When an officer said to Elsie Janis at the close of an entertainment in a Y.M.C.A. Hut: "You have kept my men from thinking of tomorrow's battle; they will fight better because of tonight," he expressed the big, underlying purpose of the Y.M.C.A. work. In other words, the

Y.M.C.A. is Helping Win the War

The Y.M.C.A. of wartime is vastly different from the Y.M.C.A. as most people know it. Its work has assumed tremendous proportions and achieved tremendous results. It is supplying a vital need—one that is not supplied in any other way. Its work is as important as that of any other organization which the war has developed.

Those of us who are bearing the lighte part of this great war burden must realize that it is not enough to raise and train an army. It is not enough to feed and clothe our men. It is not enough to care for those who are wounded. Soldiers are people, not machines. They must be kept mentally fit to make them efficient.

2,500,000 letters are written every day on "Y" Stationery

It has been demonstrated—is being demonstrated all the time—that the nation gives freely for the building of ships, for the manufacture of munitions, for the housing, clothing and feeding of our fighting men and for providing medical aid to those who are wounded. It will give just as freely when it understands that without the games, shows, stores, reading, educational courses and home comforts which the "Y" provides, all this other giving will be futile.

Consider yourself in relation to your own work. Suppose you were taken from your job, removed to another town and put to work. Suppose at the end of each day's work you ate your supper, went to bed, got up in the morning, had your breakfast went to work and kept this up for weeks and months—nowhere to go in your idle time; nothing to do; no friends who cared about you. How long could you keep it up? How long could you do your work? That would be the soldier's life without the "Y."

Somebody said, "beware of the army that sings." Armies do not sing in response to orders. They do not sing because of the joy of fighting. They sing because their spirits are high, because they are mentally, morally and physically fit; and it is this condition of mind and body, this building up and maintaining of the morale of our men, which is the deciding factor between a victorious and a defeated army.

Everything is free in the front line canteens

Four allied activities, all endorsed by the Government, are combined in the United War Work Campaign with the budgets distributed as follows: Y.M.C.A., $100,000,000; Y.W.C.A., $15,000,000; War Community Service, $15,000,000; American Library Association, $3,500,000.

A Tire That is Puncture Proof

The Result of Ten Years' Testing

After these ten years of experimental labor and crucial tests our efforts have been rewarded. The results are that the **Brictson Tire** is proving itself a revelation to the motoring world.

It Solves the Tire Problem

Because it is—puncture proof, blowout proof, skid proof, rut proof, rim-cut proof, oil proof, gasoline proof, trouble proof.

10,000 Miles Guaranteed

Can you beat that? Many motorists will say, "I don't believe the tire is made that will run me 10,000 miles." Our emphatic reply is, "There is *one* that will do it—and that's the **Brictson.**" With every tire sold, we give a **Specific, Written, Service Guarantee for 10,000 Miles.** Of course, we could not make this exceptional offer had we not put **Brictson** Tires through the various crucial tests that have proven their superiority beyond all question. For the man who doubts, we will do more than that. We will allow you to

Try It First—Before You Pay

The combination of our 10,000 mile guarantee, our puncture proof guarantee and our unprecedented "try it first before you pay" offer, makes our proposition overshadow any project ever before attempted in the tire industry. We offer to let you try **Brictson** Tires on your car **At Our Expense.** Could a manufacturer offer a greater proof of confidence?

Retread Your Present Tires

If you have some new tires at the present time, apply **Brictson Treads** and make them puncture proof, blowout proof, skid proof, rut proof, rim-cut proof, oil proof, gasoline proof—**Trouble** proof. This will convince you of **Brictson** quality and will mean that for the future you will use nothing other than **Brictson** Tires.

Or, you no doubt have in your garage a few old casings where the rubber tread is worn thin. Here is your opportunity to apply **Brictson Treads,** making them proof against all road troubles and get a good long mileage from them.

Don't bother about writing a letter. Just clip the coupon at left, fill it in and mail to us **Today.** It puts you under no obligation.

HOW ABOUT YOUR EMPLOYEES?

It is a generally accepted fact that employees of any company who have been encouraged to be careful in their expenditures, to save their money and to invest it judiciously do *better* work, have *greater pride* in their jobs, and *greater loyalty* to their employers.

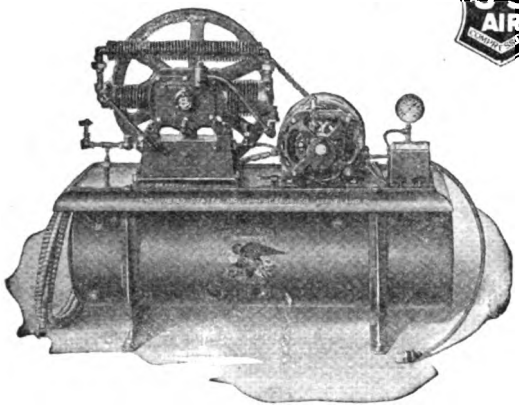
The United States Government now offers employers an unusual opportunity for the systematic organization of their employees for THRIFT through the founding of War Savings Societies.

GROUP SAVING through War Savings Societies bolsters up esprit de corps. It encourages economy in personal and company expenditures. It develops loyalty to company and country.

The organization of a War Savings Society among your employees will be a direct help in winning the war, not only because it helps directly in Government financing, but also it releases men, money and materials for essential war work through the saving on non-essentials.

Perhaps you haven't thought of a War Savings Society for *your* employees in just this way before.

Why not organize a company of savers among your employees under *your* leadership and turn it over to the Government?



We will be glad to give you full particulars if you will write

IMPORTANT POINTS ABOUT PAINT AND VARNISH BRUSHES

A Set of Three Brushes and the Automobile Dealer and Repairer for One Year for $2.00

Brushes Needed in Repainting and Varnishing an Automobile.

Did it ever occur to you that there was much difference between a good paint or varnish brush and a poor one? Probably not. To most people a brush is just a brush. Yet an analysis shows that there is an almost measureless difference between a good brush and poor one.

For instance, a properly made Flowing Fitch brush is hermetically sealed, so as to keep the paint, or whatever may be used, from getting into the brush at the top and loosening the hairs. All such properly made brushes are solidly set in glue cement inside a leak-proof ferrule, and a whole row of neatly clinched nails are driven in at the end of the ferrule to give added security, and a guarantee that the hairs will not pull out.

A Fitch brush is *smooth, soft,* and *flowing,* and does not "mush" up or get flabby like a cheap brush, but holds its springiness. The trouble with cheap brushes is that the ferrule is nothing more than a single band of tin, open at the top, with a couple of nails jabbed through. When you use such a brush the cheap hair will pull out and scatter all over your work, because it is not held in securely enough to stand the drag of the brush in painting or varnishing.

A brush may be washed with gasoline or kerosene oil, but to clean it thoroughly turpentine should be used. No brush used for painting should be used for varnishing.

We have recently made arrangements with one of the best manufacturers of these properly made brushes in New York to offer a set of Three in connection with a subscription to the AUTOMOBILE DEALER AND REPAIRER for a year for an even $2.00. These brushes sell at retail for $1.40. It will be seen, therefore, that there is a substantial advantage in sending to us for the AUTOMOBILE DEALER AND REPAIRER for a year, and for a set of these brushes.

Present subscribers can have their subscriptions extended for a year, and secure a set of brushes, on the same terms. These brushes are guaranteed in every respect, and though they cost more than cheap brushes would cost, they are far cheaper in the end, because of their lasting qualities and the good work that can be done with them. No man can afford to waste expensive paint and varnish on an automobile by using a cheap and poorly constructed brush, such as is usually to be found wherever brushes are sold. The ordinary dealer in brushes himself as a rule has very little knowledge of the quality of the brushes he sells.

Remit by check or money-order, and your name will be entered as a subscriber to the AUTOMOBILE DEALER AND REPAIRER for a year, and a set of these brushes, which are just the right size and shape (see illustration, which is exactly one-half the actual size of the brushes,) will be sent to you, postage prepaid.

WHITING-ADAMS BRUSHES

Several Reasons for Buying WHITING-ADAMS Vulcan Rubber Cemented Brushes

1st. The bristles and hair are highest grade, prepared for use by the WHITING-ADAMS method, which retains toughness, elasticity and a velvet softness of ends. This makes the part of a brush that is used, perfect in quality and long wearing.

2nd. Every bristle and hair is held by pure, best quality RUBBER; no fake, coal tar, chemical imitation of rubber is used in our factory. "Rubber" means PURE RUBBER in all WHITING-ADAMS VULCAN RUBBER CEMENTED BRUSHES. The butts of bristles or hair are completely saturated and surrounded with STRICTLY PURE RUBBER in semi-liquid state, and then vulcanized hard as granite.

3rd. WHITING-ADAMS Brushes cost little and wear long. Our large volume of business reduces cost of manufacture to lowest point, and selling prices are made near to cost.

4th. Manufacturing brushes as we have for over 106 years means that we know brushes, and users of our brushes receive the full benefit of our brush knowledge.

DYKE'S AUTOMOBILE ENCYCLOPEDIA

Entirely re-written, hundreds of illustrations and many new subjects added. Practically a new book. A non-technical treatise with simplified illustrations on Constructions, Operation, Repairs and Adjustments, Cares and Troubles of the Automobile.

There are 50 Instructions—Simplified and practical.

3500 Illustrations—the kind you understand at a glance.

3 Supplements, parts printed in colors, treating on the construction, operation, repairing and adjusting of the **FORD** and **PACKARD**—tells how to make a Ford do 60 miles per hour; how to get more mileage per gallon; how to convert into a truck, racer, fine point adjustments, etc. **Airplane Supplement.**

775 Illustrations and **279 pages** on **Electric Ignition, Electric Starters and Generators**, etc.

51 pages and 254 illustrations on **Adjustments, Tests**, etc., of leading **Electric Systems.**

184 pages and 1189 illustrations on Repairing. Oxy-Acetylene welding, and subjects as Repairs on all types of Axles, Differentials, Steering Devices thoroughly covered—as well as all parts of the Engine.

27 pages and 180 illustrations on Tires and Tire Repairing.

44 pages and 119 illustrations on Carburetion.

89 pages and 291 illustrations on Engine and Parts.

16 pages on Digest of Troubles.

6000 lines to the Index. This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. **Index begins on colored paper, easy to refer to.**

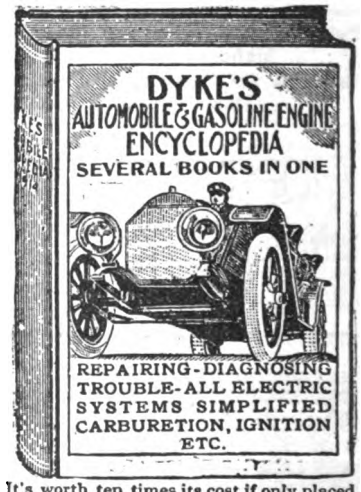
Dictionary is also included, which gives the meaning of motoring terms.

Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

NEW ADDITIONS
TRUCKS, TRACTORS, MOTORCYCLES, AIRPLANES AND AIRPLANE ENGINES.

Price $3.82, Prepaid, Express.

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

Fewer Men Can Accomplish More With These Helps.

The more men the army needs and takes—the more mechanical equipment must you put in your battery shop to get out the work. Therefore, NOW is the time you must help your men with these time and labor saving devices. And they are money makers for the shop too.

Ambu Battery Steamer

Softens up the "compound" and enables the men to open the battery in the shortest time with no chance of damaging the box. Many a shop has lost the profits on several jobs by having to replace battery boxes broken in opening. Takes but a few minutes to open any battery. ***Each $25.00***

Ambu Battery Plate Press

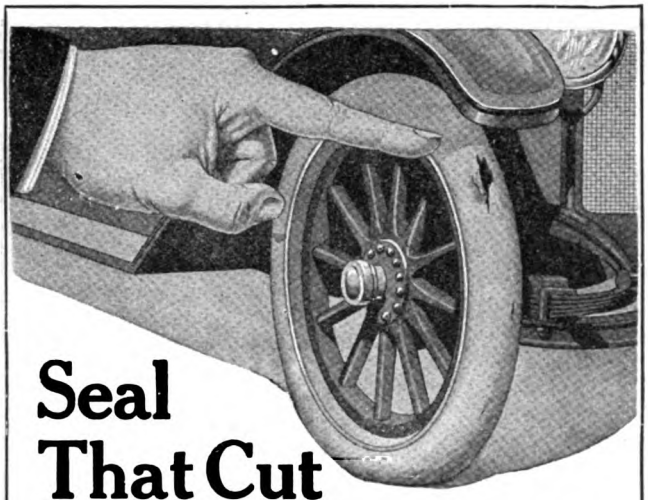
Probably one of the most valuable "salvage" devices. By pressing plates properly the life of a battery is doubled and new installations avoided. Made of specially finished wood, acid-resisting. Saves its cost in the time lost in cleaning up the metal vise that has been corroded by acid and water. Produces perfect plates in a short time. ***Each, $32.50***

Ambu Plate Burning Rack

Burning-in new plates in a battery, without the use of a rack, is a long hard job. The AMBU Plate Burning Rack holds every plate in proper place till finished. Saves its cost on first three jobs. ***Each, $7.50***

Lead Molds

Save all the old lead in your shop. Melt it down into usable form in these handy lead moulds. Save their cost in salvaged metal in a few days. Every shop needs a pair and large shops several. ***Each, $1.80. Pair, $3.50***



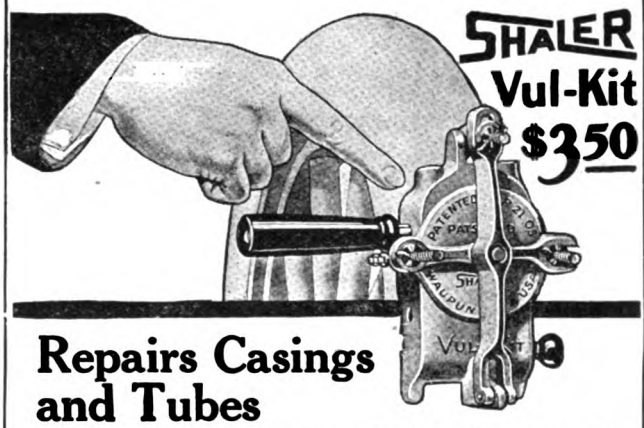
"The Automobile Storage Battery"

A technical book in non-technical language that tells the theory and actual practice in the care and repair of storage batteries. Should be in the office of every shop for reference. ***Postpaid, $5.00***

Every device listed here has been tested and is in use in the leading shops of the country. We guarantee entire satisfaction or your money back without question.

If your jobber cannot supply you write direct.
Ask for our booklet of Battery Shop Helps.

AMERICAN BUREAU OF ENGINEERING
1025 S. Wabash Ave., CHICAGO
Makers of A M B U Electric Trouble Shooter



Seal That Cut and Save the Tire!

Casing cuts, punctures, tears, etc., admit moisture, oil, dirt and sand—to the inner fabric of the tire. The moisture soon rots the fabric while the friction of the sand cuts the threads and weakens it. Then you have a big blow-out and expensive repair bills.

The limited supply of tires, and their increasing cost makes it imperative for every motorist to keep the rubber tread—which protects the inner fabric of the tire—water tight—sand tight—oil tight—in order to prolong the life of the tire and get maximum mileage.

You can easily double your mileage—prevent tire trouble—save the cost of new tires and repair bills, by going over your tires once a week with a Shaler Vul-Kit and sealing the cuts, punctures, tears, etc., with new rubber, thoroughly vulcanized. It is easy to do and only requires a little time occasionally when your tires need attention.

The Shaler Vul-Kit repairs all size casings without removing the tire from the wheel or letting out the air. It makes perfect tube repairs—stronger than the tube itself—a perfectly vulcanized repair that can't loosen or cause friction.

Repairs Casings and Tubes

This handy outfit for motorists' use—complete with repair material, only cost $3.50. It has Automatic Heat control which insures perfect results. Burns gasoline or alcohol safely without any exposed blaze. No watching or regulating necessary. Anyone can make perfect casing and tube repairs with it. Simple, safe—sure—fits in tool box.

All Accessory Stores Sell It

Ask your dealer for a Free Demonstration of the Shaler Vul-Kit. See for yourself what perfect work it does. Then figure out how much this handy outfit will save you in tire expense.

Free Book *"Care and Repair of Tires"*
is full of valuable tire information. It is mailed free to any motorist who sends us the name of his accessory dealer or garage.

TRADE MARK Red Devil Tools

KEEP YOUR EYE ON YOUR "RED DEVILS"

There's only one trouble with "Red Devil" Tools—that's their habit of straying into some other fellow's kit. Tell him to buy his own. Guaranteed—absolutely.

At all dealers or write us.

Smith & Hemenway Co., Inc. 83 COIT STREET, Irvington, N. J.

Made from Oil-Tempered Spring Steel Wire

They Remove Carbon Where Others Will Not

PATENTED MARCH 28, 1916

Cut out experimenting—get down to business. Why not own a set of FLEXIBLE CARBON SCRAPERS? They are the only scraper on the market that will do a satisfactory job without taking the motor to pieces. Compounds are dangerous. All good mechanics advise scraping carbon. Over 100,000 sets now in use by Auto Mechanics.

Price Per set, $1.50. Ask Your Dealer or Write

National Needs

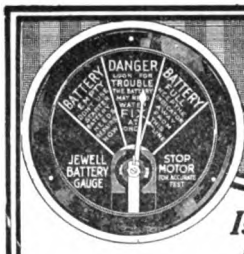
have made curtailment of rubber imports necessary. Already the excess of demand over supply has caused an increase in tire prices—other increases are imminent.

It's Time Now for Economy

If your heart is in this war, you will clearly see the need of getting the last fraction of a mile out of your tires. You can do so by coupling your patriotism up with

National Tire Filler

Motorists Have No Tire Trouble Who Ride on This Perfect Substitute for Air



Rim-cut-proof, blowout-proof, puncture-proof tires are now a reality. Motoring is now freed from the shackles of tire trouble, and is made safe, comfortable and enjoyable.

National Rubber Tire Filler replaces the inner tube. It has all the resiliency of an air-filled tire with none of its disadvantages. It lasts indefinitely—40,000 miles or more. It has been in use for five years and has conclusively proven its superiority and economy over air-filled tires. Our factory taxed to capacity is proof positive of its great popularity.

It rides as easy as air.
It cannot puncture or blowout.
It can be used on all style tires.
It doubles tire mileage.
It is easily installed.
It stimulates motoring.

National Rubber Filler Co.

FROM small vulcanizers for repairing tubes, to large many-unit outfits for rebuilding and retreading tires, there is an Akron-Williams outfit to fit every need.

Each machine and tool has been developed and perfected in Akron—the center of the tire industry,—through the combined efforts of our own engineers, and tire experts of the large rubber factories.

Users of our equipment get the benefits of the very latest improvements in tire repair methods, and they ***get them first.***

Akron-Williams equipment is used in the factories of all leading tire companies and recommended and sold by them to their dealers all over the world—absolute proof of its superiority.

To do the best tire repair work, you must have the most approved equipment—Akron-Williams

Johns-Manville HUB ODOMETER

Take your future maintenance item—

AND consider its rising cost. Do you know what it costs you per pound, or per ton, to carry a load just a foot, or a mile? Do you know on each haul the cost to a cent—of labor, fuel, material and time? Be honest with yourself. With a Johns-Manville Hub Odometer you can know all this and more. You will know the cost of a single wheel turn—and your actual earnings. With this knowledge you have solved the problem of future maintenance cost.

The Johns-Manville Hub Odometer is a mechanically perfect register of truck performance. It is made durably for long life and all makes of cars. It is dust and grease proof, and easy to install. List prices can be had on application, and prompt delivery is assured.

H. W. JOHNS-MANVILLE CO.
New York City
10 Factories—Branches in 63 Large Cities

We guarantee the Johns-Manville Hub Odometer against defective material and workmanship and to be grease and oil proof for one year from date of sale.

Don't scold your FORD if it gets full of carbon

Make your pistons tight and stop the carbon jinx. Munger "Always Tight" Piston Rings FIT and hold compression so that you can adjust your carburetor ACCURATELY.

You get perfect combustion; that means NO CARBON. The "Always Tight" Expansion Joint makes these rings PERMANENTLY gas-tight by compensating for wear as it occurs.

Price, $1.25 each for all sizes up to 3-3/4 inches in diameter.

The complete FORD Set consists of eight regular size "Always Tight" Rings for the lower grooves and four over-width "Always Tight" Rings for the top grooves. With each complete FORD Set a Munger Regrooving Tool and a Munger Ring Insertion Tool are included FREE.

Get them from your supply dealer or garage man.

CONNECTICUT "Q D" TERMINAL

Standard Equipment on the Liberty Motor

HERE is the simplest and most satisfactory spark plug connection ever devised. While it is easily attached and detached, connection is positive and cannot jar loose.

The terminal is furnished with a highly insulated collar, making it safe to handle —without risk of shock.

The wire connection is made without soldering, as the screw, in imbedding itself in the strands of the cable, expands and makes the tightest kind of fit with the collar. The ears in turn fit over a hexagon ball nut which screws on the spark plug, as shown in the illustration.

No other terminal gives half the satisfaction in service or half the convenience for inspection as this one does.

Its adoption by the United States Government as standard equipment on the Liberty Motor is a most convincing endorsement of its practicability.

Collars are furnished for 3/8 in., 7 mm., or 5/16 in., 9 mm., and the ball nuts are tapped for any thread.

CONNECTICUT TELEPHONE & ELECTRIC COMPANY
MERIDEN CONN.

STAR LATHES

Remember the Second Factor

The amount of work you can do depends on **two** factors.

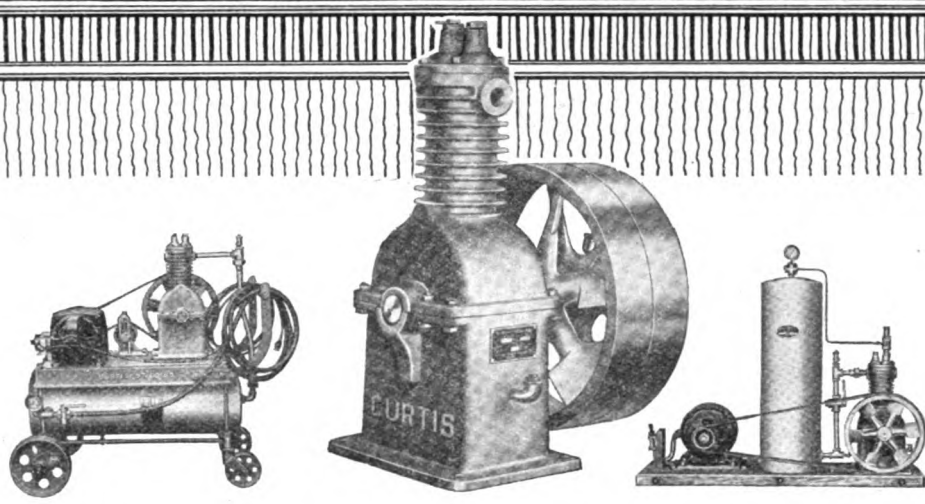
First, the number and caliber of the men you employ.

And second—and equally important — the equipment these men operate.

For instance, the combination of features found exclusively in Star Lathes means that you can use "small lathes" for a far greater variety of work—either light manufacturing or repair work.

By using Star Lathes with their high accuracy instead of larger, heavier lathes, perhaps thought necessary, you get all of these advantages—

(1) Saving in floor space.
(2) Saving in first cost.
(3) Greater production through simplicity of Star Lathe operation.
(4) Saving in power.



The Star Lathe catalog has details. You should have a copy. Write for it now.

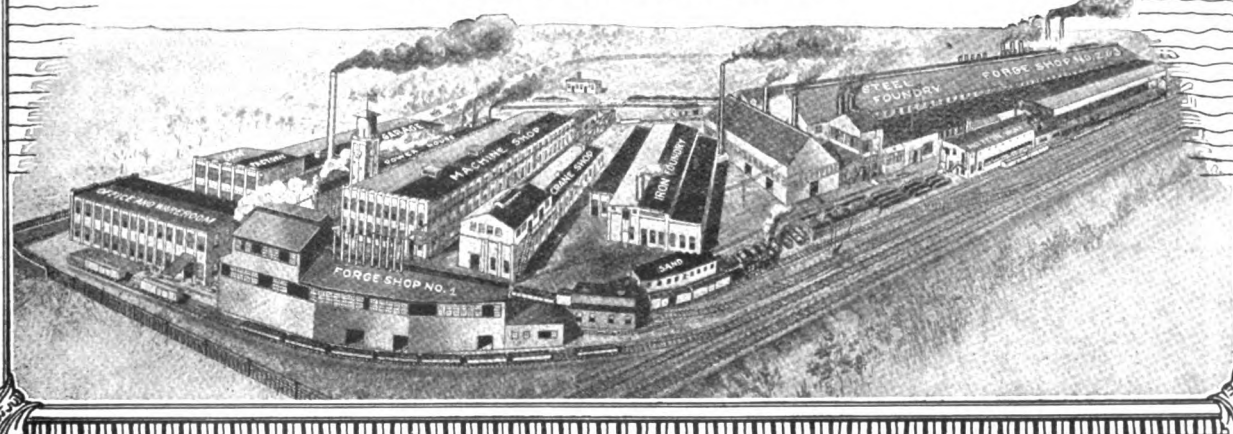
"The Plant Behind the Product"

SINCE 1854 (seven years before the Civil War) this organization has continued its steady growth and development—has weathered the storms of three great wars—and today our plant covers nearly twenty acres—employs over two thousand men, and has a national reputation for the superiority of its product.

Of our war record we are justly proud. From the first days of America's entry into this great struggle, the CURTIS COMPANY has been in the Service—one of America's Volunteer Industries that has contributed its utmost to the victory that has been achieved. And now—with a greater organization and largely increased facilities—the heritage of our war activities—we are able to serve you even better than before.

The CURTIS Model "B" Garage Air Compressor stands pre-eminent in its field—the perfected result of our sixty-four years of successful manufacturing experience and over twenty-five years of specialization on pneumatic machinery.



You can install a CURTIS Compressor with the utmost confidence in its design, construction and fitness to perform its duty—and with the assurance it will render unqualified service for years to come.

"Ask your jobber."

STUMPED–BEATEN

And By a Storage Battery, Too!!

"Charged all O. K. but didn't hold up—tested out on the voltmeter and hydrometer all right; but when used, the battery charge flattened right out. I don't know what can be the matter."

Ever think that one set of plates might be defective—not doing its duty and thus "kill" the charge? Well, test each and see which needs fixing or replacing. Test them right in the battery with an AMBU CADMIUM TEST OUTFIT, with specially calibrated, positive and negative voltmeter. That will tell you exactly. Ask your Jobber for prices.

You Will Find the Answer Here

This book—technical in non-technical language—tells everything that may be the trouble with a storage battery and the way to fix it—tells how to keep it in good condition all the time.

AUTOMOBILE STORAGE BATTERY, ITS CARE AND REPAIR

Leather bound, of over 300 pages, so written that everyone can understand. Written by experts. Every repairman can open new work for himself—a better position if he knows all this book can teach.

Every garage office should have one for reference. Five days' examination. If not the best thing of its kind, return it for your money. $5 postpaid. Sold by jobbers and direct.

The Anthony Company, Long Island City, New York

The United States line comprises 90 different numbers in Two-Stage and Single-Stage Types, and various individual equipment adapted for forming combinations of almost unlimited kinds and capacities.

This is the U. S. De Luxe Compressor

Perfect in Design, Material, Workmanship and Finish

THIS machine embodies every feature recognized as good air compressor design, plus several improvements distinctly its own. This combination has gained for it recognition as the most practical compressor available and placed it in a majority of the better garages, tire shops and gas stations.

The 14 definite points of superiority are explained in detail in our literature, but those who have had experience with air compressors are invited to tell us their specific troubles in order that we may explain just how that particular difficulty has been eliminated in the De Luxe design.

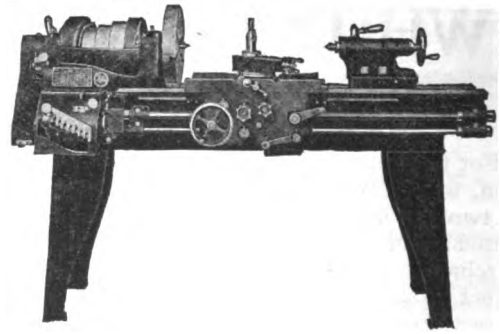
Guaranteed for 10,000 Miles

EVERY Brictson Tire is sold under a specific 10,000 mile written service guarantee. This guarantee is the longest and strongest ever put behind a pneumatic tire and is a positive protection to every purchaser.

"Absolutely Puncture Proof"

Brictson Tires are puncture proof, and proof against blowouts, skidding, rut wear, rim cuts, and can't be damaged by oil or gasoline. Wonderful resiliency, easy riding qualities as well as economy commend them to car owners,

The Big One-fourth Retread Feature



Should the tread surface wear out after 10,000 miles of service you can get a new retread for one-fourth the original cost of the tire, instead of buying a new tire, and you keep the remaining three-fourths in your pocket. With ordinary service the Brictson Tire should run enough beyond the 10,000 miles to require one or two extra retreads. The more retreads you use the cheaper your service.

FREE TRIAL OFFER

To convince you the Brictson Tire will give satisfaction TRY THEM ON YOUR CAR AT OUR EXPENSE. Write today for this Free Trial Offer, a copy of our guarantee and full information about Brictson Tires.

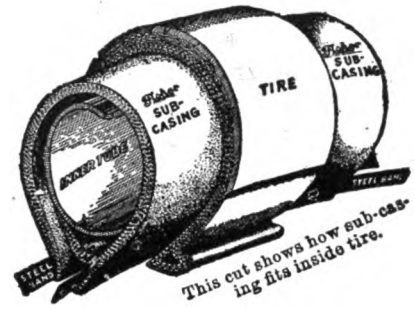
THE Fisher PATENTED "RIM-GRIP" SUB-CASING

MORE MILES PER TIRE

LESS TIRES TO BUY



The Blows That Your Tires Receive, When You Strike Objects in the Road, Leave Weakened Places in the Fabric

A TIRE IS AS STRONG AS ITS WEAKEST POINT

The weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings.

National Needs

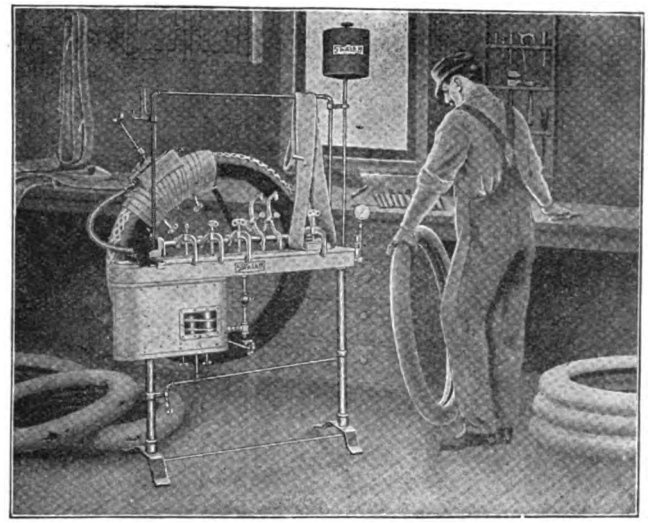
have made curtailment of rubber imports necessary. Already the excess of demand over supply has caused an increase in tire prices—other increases are imminent.

It's Time Now for Economy

If your heart is in this war, you will clearly see the need of getting the last fraction of a mile out of your tires. You can do so by coupling your patriotism up with

National Tire Filler

Motorists Have No Tire Trouble Who Ride on This Perfect Substitute for Air



Rim-cut-proof, blowout-proof, puncture-proof tires are now a reality. Motoring is now freed from the shackles of tire trouble, and is made safe, comfortable and enjoyable.

National Rubber Tire Filler replaces the inner tube. It has all the resiliency of an air-filled tire with none of its disadvantages. It lasts indefinitely—40,000 miles or more. It has been in use for five years and has conclusively proven its superiority and economy over air-filled tires. Our factory taxed to capacity is proof positive of its great popularity.

It rides as easy as air.
It cannot puncture or blowout.
It can be used in all style tires.
It can be installed on all makes of rims.
It doubles tire mileage.
It is easily installed.
It stimulates motoring.

National Rubber Filler Co.

208 College Street **Midlothian, Texas**

Make Money Now Repairing Tires

The increasing cost, and limited supply of tires makes it necessary for motorists to conserve their casings and tubes—to get the maximum mileage. Present conditions offer tire repair men a big opportunity to make money—and help win the war. Experienced help is not necessary. A boy can learn how to make perfect tire repairs in 30 minutes. Every car owner in your town is a possible customer. Jobs are plentiful, because tires blow out and puncture every day. Motorists are willing to pay liberal prices for repairing punctures, blow-outs, cuts, tears, rim cracks, etc.

SHALER SHOP VULCANIZER

Is the Only One That Has

Automatic Heat Control

Will do as much and as perfect work as the large, expensive vulcanizing outfits which cost from $250 to $500. The price of this Complete Steam Vulcanizing Plant—heated with either gas or gasoline—is remarkably low—$70 subject to Trade Discounts. Outfit shown above is Type N. P. R.—No. 41—other models heated by steam or electricity are described in our catalog.

It is portable—easily moved to any part of the shop—occupies, but little floor space—a boy can operate it easily, and make perfect repairs. The Shaler Patented System of Automatic Heat Control regulates it automatically. It must vulcanize just right. Can't overcure or undercure, and requires no watching or regulating. Large capacity. Repairs 12 casings and 200 tubes a day. Handles any style or size of tube or casing.

The Shaler Wrapped Tread Method of tire repairing is used by all tire manufacturers. It mends casings and tubes quicker, better and at less cost. We furnish Complete Instructions with each outfit. So simple that anyone can do perfect work.

Helping Your Car To Hibernate

He tucked away his little Ford, upon a winter day; then he forgot his new machine and calmly walked away.
The cold winds blew, the water froze, the snow it heaped around; but still that Ford stood shivering upon the cold, cold ground.

* * *

When winter's blast had ended quite, and robins 'gan to sing; his thoughts turned toward the broad highway, like birds upon the wing.
Back to the shed that owner went, his little Ford was there; its paint was cracked, its top was creased, and tires devoid of air.
Forth from its damaged cooling parts, the water slowly dripped. He started up the engine new; the water jacket ripped.
And while he cussed, the engine groaned, a wreck 'twas plain to see; his pocketbook gave one mad leap (you can't get things done free).

* * *

"Ah me! Oh my!" he vainly cried, "Had I but used my head, in putting up my auto'beel, it would not now be dead.
"Had I but drawn the water off, and jacked it from its wheels; I would not face an expert's bill, or go without my meals.
"Out through the country would I speed, a man from care set free; but now I own a mess of junk, that couldn't chase a flea."

* * *

The moral of this short, sad tale, to you is surely plain:—wax will not stand the Summer's sun, nor flowers the Winter rain.
If you would keep your car intact, from Winter's zero weather; take our advice herein contained—observe it to the letter.

I WONDER how many of the readers of this magazine have ever watched a caterpillar go to bed for the winter, and I also wonder how many have tried to get the caterpillar out again before it was time for the butterfly to emerge from the cocoon? One thing is certain, if you have seen or tried either of these things, you will realize that Mother Nature is the most careful person on earth when she puts away her treasures for the winter. Her work simply stamps the average automobilist with the sign of "piker," to use a slang expression.

Mother Nature never does things by halves, and seldom makes mistakes. The smallest worm, as well as the largest tree are carefully attended to by her, and she seldom allows anything to be lost or to die.

Perhaps you are wondering just how a cocoon relates to an automobile. I doubt very much if any of you spend one-tenth as much time putting away your thousand dollar machine for each winter as Mother Nature does for her seemingly worthless caterpillar. The average autoist takes great pride in his machine. Many of them spend more time working on the machine than they do riding in it, but as soon as snow begins to fall, their interest abates.

No longer can they drive around in their automobile,

Digitized by Google

and so they run it into the garage, shut the doors, and forget about it until the coming spring. The intelligent repairman will tell you, if you ask him, that the automobile, if not properly attended to before it is stowed away, will depreciate more during the winter than during a running season. The tires will die; the running parts will rust; the finish will spoil, and the whole car will require possibly a week's more work to put it in shape again than it would have required to have taken care of it properly before putting it into storage.

First Wash the Car.

The tires probably depreciate the most of any part of the car if they are not used; therefore they require considerable attention if one intends to use them for another season. Before running the car into the garage after its last fall trip, the whole car should be given a thorough washing. All of the mud and grit should be removed from the finish, the cushions dusted, the top smoothed out, and the mud and oil washed from tires. Then the car should be driven into the garage, and supported upon jacks such as are illustrated in Figure 1.

Then the tires should be deflated and removed from the car, and again given a very thorough washing, so as to remove any grease that may be present. Place the tires in a warm, dry room until they are perfectly dry. This is important, because if there is any moisture in the pores of the rubber it will freeze and crack open the tire, much the same as water would crack open the cylinder jackets or radiator, if it were left in those units.

Repair the Tires.

At this time, all of the little holes or blowouts should be filled and vulcanized so that no crevice will remain in

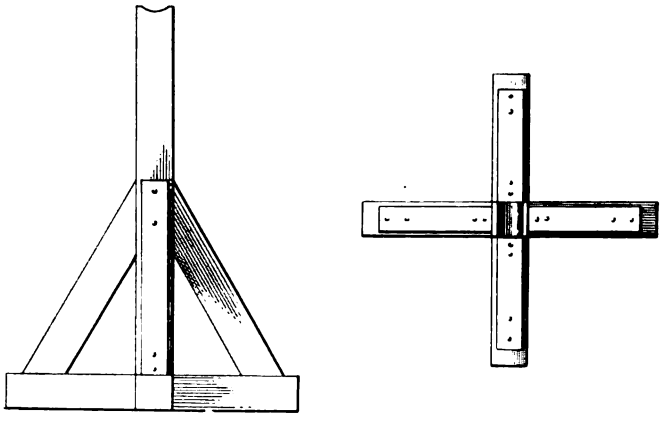

Fig. 1. Construction of a Winter Car-Supporting Block.

which dust or dirt may lodge. Then the tires should be wrapped with a heavy grade of brown paper, as shown at A in Figure 2.

This may seem like a big job to the autoist, but if he will think for a minute, he will realize that he is saving money. Do not all of the tire manufacturers wrap their new tires with paper? Then is that not a good argument in favor of this procedure, for surely a tire is worth just as much to you as it is to them, in fact, it costs you more than it does them to permit a tire to spoil?

Now, there are two ways of storing tubes for the winter. The tubes can be partially inflated, that is, just enough air placed in them so as to prevent their walls from sticking together. Then they may be placed inside the shoes. In my opinion, however, the tubes should be folded carefully and packed away in a moisture-tight box, or in a bag made of rubber-covered cloth.

There is only one practical way to fold a tube, and since so few automobilists really know how, I have drawn a sketch of the various steps and reproduced it in Figure 3. First remove the insides of the tire valve. The top of the valve cap is the special tool used for this purpose, and the insides unscrewed from the case. Then place the tire flat upon a table as shown at A and beginning at the end M, roll the tire up tightly as shown at B.

This procedure will force out all of the air in the tire, and if the tire were unrolled again, of course the air would go back into it again, therefore replace the valve inside to prevent the air from returning. Then unroll the tire and place it flat upon the table again with the valve at the center as shown at C. Fold over the two ends M and N as shown at D, then refold as shown at E.

Do the same with all of your tires and wrap them in paper, or as suggested above, place them in a box or water-tight case and put them together with the wrapped shoes in a cool, dry, dark corner of the garage. Heat, light, moisture or oil cause tire depreciation. Therefore guard against all of these things.

Drain the Water System.

Every automobilist knows enough to drain the water from the cooling system. As a matter of fact, I have always known it myself, but through my carelessness, I once permitted the cylinders of a car which I owned to freeze and crack. I had drained the radiator very carefully, and my surprise was great when I noticed the cracks the following spring.

Investigation showed that though I had drained a portion of the system, there had been a small pocket in one of the cylinders which still held water. Thereafter I always followed the directions of an old automobilist who perhaps himself had been caught at some time or other in the same trap.

"When I put my car away for the winter," he said, "I am always careful to run the car into the garage after the engine is thoroughly heated. While the water is still steaming, I open the drain at the bottom, and draw off as much water as I can. Then I disconnect the rubber fittings, and as the engine is still warm, the rest of the water soon steams away. If there are any pockets, the small amount of water in them will boil very quickly."

Don't make the mistake, however, and start your engine after you have drained off the water, for if you do you will be obliged to buy a new engine.

Have you ever tried to clean a piece of steel with kerosene oil? If so, you may have noticed that though the

Digitized by Google

kerosene removes rust at first, unless the kerosene is wiped carefully from the steel or iron, the metal will rust again very quickly. The present-day fuel comes pretty near being pure kerosene. Therefore it is not good policy to forget the lubricating system in stowing away the car.

Clean the Lubricating System.

Remove all the oil from the base of the engine, and pour into the base about two quarts of kerosene oil. Open the compression cups, or unscrew the spark plugs, and turn the engine over by hand one or two dozen times, so as to distribute the kerosene all through the lubricating

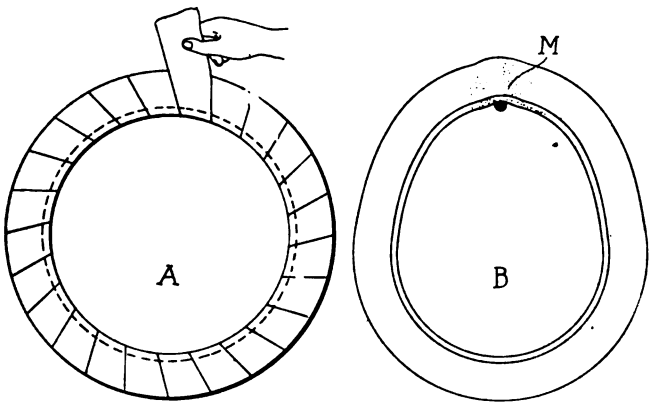

Fig. 2. A, Illustrates Method of Wrapping Shoe for Storage; B, Wrong Way to Store Shoes Hanging on a Peg.

system. Then drain off the kerosene. It is best to turn the engine over once or twice with the drain cocks open so as to remove any kerosene that may be in the oil pump or other parts.

Then fill the lubricating system with fresh cylinder oil to the proper level, and turn the engine over again two or three dozen times so as to distribute the oil to every part. Two teaspoonfuls of oil poured into the top of each cylinder prevents rust from forming on the cylinder walls. Once rust is formed on the cylinder walls the engine is badly damaged.

What is true of the engine lubricating system is also true of the transmission. Both the gear-set and the differential should be cleaned in the same way as has been the engine, with kerosene oil. In every case, however, before putting up the car for the winter, new lubricants should be supplied. If it is practical the engine should be spun a number of times during the winter so as to redistribute the oil occasionally.

There are two kinds of lubricants—one is mineral, the other vegetable oil. The oil left in the engine during the winter should be distilled from mineral base oils, or there is danger of corroding the steel.

Occasionally we find a person who makes a habit of washing his face before he retires at night, and if I am not mistaken, you will find that most beauty doctors recommend this procedure. If I were writing for a magazine on hygiene, I suppose I could add a few more paragraphs along this same line, but there is a parallel case in automobiledom.

One should not retire his car for the winter leaving deposits of oil, grease and dirt on the varnished surfaces. Varnish is peculiar stuff, and no matter how hard it may seem to be, an atom of dirt will work into its surface if left long enough. Greasy dirt will of course soften the finish and destroy its lustre. Washing does not always remove all of the dirt, and you will find it to your advantage to spend two or three hours going over every inch of the surface with a body cleanser or paint renewer of some sort. Be sure to buy a well advertised, and well-known product. After being sure that the surface is clean, a coat of wax (the writer uses Johnson's), helps to keep the finish in condition during the winter.

There is an old saying to the effect that a man is known by the clothes he wears, and as a comparison, one might infer that an automobile is known by the appearance of its top. The shabby top ages a car at least five years in appearance, yet very few automobilists know why the top seems to grow shabby so much sooner than the rest of the car. Carelessness in folding it, or lack of attention when putting it up for the winter are usually the two reasons.

The mohair or lining should be given a good brushing with a stiff whiskbroom just as carefully as you brush your suit before you put it away. Some tops can be sponged with Ivory soap and warm water. There are a number of top preservatives now on the market which could be applied before the top is folded.

The top should never be left open to accumulate dust and dirt, but enclosed in a heavy bag of some sort. A rubber-covered one is much to be desired. The greatest

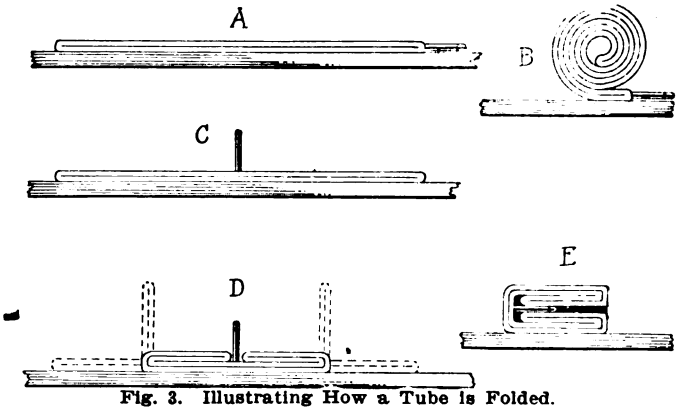

Fig. 3. Illustrating How a Tube is Folded.

of care should be exercised in folding the top else the creases will result in cracks in the waterproof surface. Spend an extra half hour folding the top.

An Excellent Plan.

Now, folding the top when putting it away for the winter is not always the best idea, but if the machine is to be left in a dusty garage, or an unheated garage where there is a chance that the snow may seep in, this method is to be preferred over leaving the top up. No matter how careful one may fold the top, there is always great danger that it may be creased.

If, however, the autoist cares to make the investment, he can purchase one of the large paper bags or paper covers, which are now on the market designed expressly

Digitized by Google

for covering the cars during the winter months. When these covers are used the tops may be left up, or they may be removed from the car, stretched open, and placed over the seats. In this way, they do not take up as much room as ordinarily.

Few motorists realize that the storage battery requires particular attention if it is to be left for any length of time. The electrolyte in a fully charged battery will not freeze, but if the battery has been allowed to run down, there is danger that the liquid in it will freeze and damage it. Therefore it is always best to have the battery fully charged upon storing the car, and every month thereafter, test it to be sure that it is not discharging itself. The storage battery stations in practically every city will store a battery during the winter at a minimum price. In any event, do not leave the battery upon the car unless the car is kept in a heated garage, but remove it and place it in a building in which the temperature seldom drops below 50 degrees.

Exposed metal parts of the car are very apt to rust unless some means is used to protect the parts. The rims deserve special attention. Remove all of the rust with kerosene oil and a scrubbing brush, or special rust remover, and give the rims a coating of special rim paint. The other exposed portions of the metal work, such as hinges, steering gear shafts, etc., may be coated over with a mixture of paraffin and gasoline. To prepare this mixture (which by the way makes an excellent squeak preventative), heat a pail of water, and when it has been brought to a boil, remove it from the stove, and place in it a can of about one-half a teacupful of gasoline. Dissolve in this gasoline as much paraffin as possible, in other words, make a saturate solution. Then add about four teaspoonfuls of gasoline to prevent the mixture from solidifying, and paint the exposed metal parts with it. Incidentally, this same mixture can be used around the house for coating slides, draws, hinges or any parts liable to friction.

Holiday Show Window Advertising

It Is the Man Who Takes Off His Coat and Gets Down to Real Hard Work That Sells the Goods.

BY FRANKLIN MYERS

NATURALLY a man who is used to getting up window displays finds but little difficulty in thinking up an idea that will catch the eyes of the people. He is used to it—he has the courage of his convictions and, working upon the plan of "he who hesitates is lost," goes straight to work on the idea that strikes him as being good and eliminates all doubt as to the drawing power of the display.

This absolute decision on his part makes for a better exhibit because he allows no misgiving to bother his work—bestowing full concentration of the mind on the matter in hand compels the window display to be what he means it shall be—a successful, money winning show window. I know of many retail accessory dealers who have splendid ideas but not the time to execute for the actual display. Where they fail is in throwing away this gift of originating by not having a good sign man to do the practical part of the work for them.

There is nothing in the world that cannot be had by the man who is big enough, daring enough, optimistic enough to want it hard enough. Not a single achievement, nothing has been done that cannot be done again, and perhaps better, the second time than it was the first. I am always glad when I see a store that has been practically dead or anyhow badly crippled by lack of enthusiasm—come back to life and smile. There once was a retail accessory dealer in a Southwestern city who was never known to smile. He was never known to put a sign or show-card in his store window. He called everything pertaining to advertising humbug.

Naturally this man's business was fast asleep—in fact, people wondered how it lived at all. The old gentleman used the word humbug so often that friends and intimates used to call him "Hum" for short. This man had a splendid location, but the people would not patronize the store because they got the impression that "Hum's" goods were back numbers and shopworn—see?

They judged the goods by the store, and if the truth were known, I am led to believe that the people in his neighborhood knew what they were about.

One day the old gentleman's son came home from college to stay and the first thing I knew the store was given over to the young man to run as he saw fit. This young man had the advertising instinct very strongly developed, naturally. The old sign came down and up went another, and it read:

"HUMBUG" HOWSON'S SON,
"THE HUMMER"

You see, the young man built upon the old gentleman's eccentricity—it was double advertising, for everybody knew "Hum"—so now, too, they were to know "The Hummer."

The old store was remodeled throughout—fresh stock and everything up to date. Everywhere within a radius of twenty-five miles "The Hummer" became known as a live wire, and to-day he is the sole proprietor of the largest retail auto accessory store in that State. He has made a young man out of his father, too, by teaching him how to smile. "The Hummer's" sign always brings a smile. Automobilists were so attracted by it and by the

Digitized by Google

proprietor that the store is a popular stopping place, and "The Hummer" caters to their wants.

All his advertising is of the pictorial order and he keeps one man at work all the time just creating and arranging "cut out" show window displays and hand-made posters.

This reminds me of a poster campaign I undertook after two other artists had fallen down on the job. A very large trade journal in New York City conceived the idea of selling to the retail dealer a spring poster, the subject to be an up-to-date, stylishly-gowned young lady riding in an automobile and throwing open the gates of spring amidst a profusion of spring blossoms, etc.

As the head of the art department, I was compelled to listen to the general conversation regarding the matter while the two artists were trying to figure out how to get the posters out in quantities.

No price had been mentioned—the whole scheme seemed to hang fire because no way could be found to turn them out by hand fast enough so that possible customers could be supplied and no disappointments registered. Naturally, the firm did not care to start something it could not finish.

I was too busy to make any suggestions had I been asked, and consequently gave the matter hardly any thought with the exception that I knew it could be done. I had no private studio large enough to handle poster work in, but I did have at home a very large parlor. All right, that would do nicely.

An Attractive Window Display to be Made by Any Good Artist.

Did you ever see stage hands "hit a scene?" Well, that's when they change the stage from one set to another set or scene. It's rapid work, and you don't want to be hanging around the stage at that time or you'll go down a flight of stairs on your head in a hurry.

Well, that's about the way I struck that parlor of mine

Digitized by Google

—cleaned it out, covered the carpet with canvas, bought forty dollars' worth of colors, brushes and super-calendered paper; mounted the paper up on a table, so that it would unroll easily, cut the paper into proper lengths of three-sheet size; three sheets of this size pressed to the side wall with thumb tacks and I had a nine-sheet poster in blank form ready for the drawing.

I already had the lady and the gates cut out of medium-thick cardboard (life size) in outline, so all I had to do was to place these cardboard forms against the paper, put in a few thumb tacks to hold them in place. In three minutes I had the lady, the automobile and the gates in pencil outline and was ready to use color.

All in a row to my left were the colors arranged and a brush in each color pot. The background of blossoms

was painted in first, the gates next and the lady and automobile next, dry scenic color being used. This medium is always mixed with glue and water and is all right for inside work, although aniline colors are sometimes used. For outside posters, printer's ink thinned or reduced is the proper medium.

One hour and a half to each poster, and I sold them at ten dollars each, and the stores were glad to get 'em. I had not mentioned anything to the firm about my plan or my preparations or anything else.

I simply placed the work before them and asked them if it was what they wanted. Why, of course, it was what they wanted! They started full page ads, going right away upon my promise to fill every order that came in the house.

I was already ahead of the game, for I had twenty ready for shipment. I am a great believer in high quality commercial art. These posters were made good and we did not have a single complaint or adverse criticism.

When in doubt take off your coat and pump in; forget the doubt and do the work. When I sat down to write this article I had no idea just what I would put down, but I had been thinking while at my drawing board in the forenoon how slow human nature really is, and no man is exempt.

Often I find myself retarding my own business by neglecting to make connections as quickly as I ought—bad, very bad habit to get into. Of course, I don't believe it is necessary for a man to get heart disease rushing things, but by keeping up a certain speed regularly it soon gets to be a very desirable habit.

The two artists who failed to land the contract for those posters lost just eight hundred dollars. They knew the method of procedure; they knew how it could be accomplished. I wasn't any brighter or smarter than those boys, but they looked at all the special preparations as if it was a mountain. They made it a mountain whereas if they had exercised their God-given power of will they could have removed the mountain.

Pessimists are not born, but they are made through just such incidents as these. After awhile "nothing is any good;" all contracts are too much trouble; "there's nothing in it, anyway;" "business is all out of gear;" "what's the use?" and all the other excuses until the man becomes a grouch, wears a long face or a discontented look and either becomes a drifter or stays in a rut.

All this when a little grit and determination would have kept the countenance in a refulgent glow and the hand clasp as hearty as ever. You can pick out the shirkers in any big city. You'll find 'em in little dark, pokey, old-fashioned offices; got a few hard raps and never fought through 'em—"nothing is any good"—"what's the use?"

Every success can be repeated by the man who wants to repeat it and works hard enough for it. In the working for it lies the rub. The reason for our failures lies in this: we have not worked hard enough. Faith, daring and hard work have conquered every element—the land, the water and the air—have done things men said were impossible and that men were not intended to do.

It is very refreshing to meet a man who can and will do things in a thoroughly whole-hearted manner—and as a rule these men are magnetic.

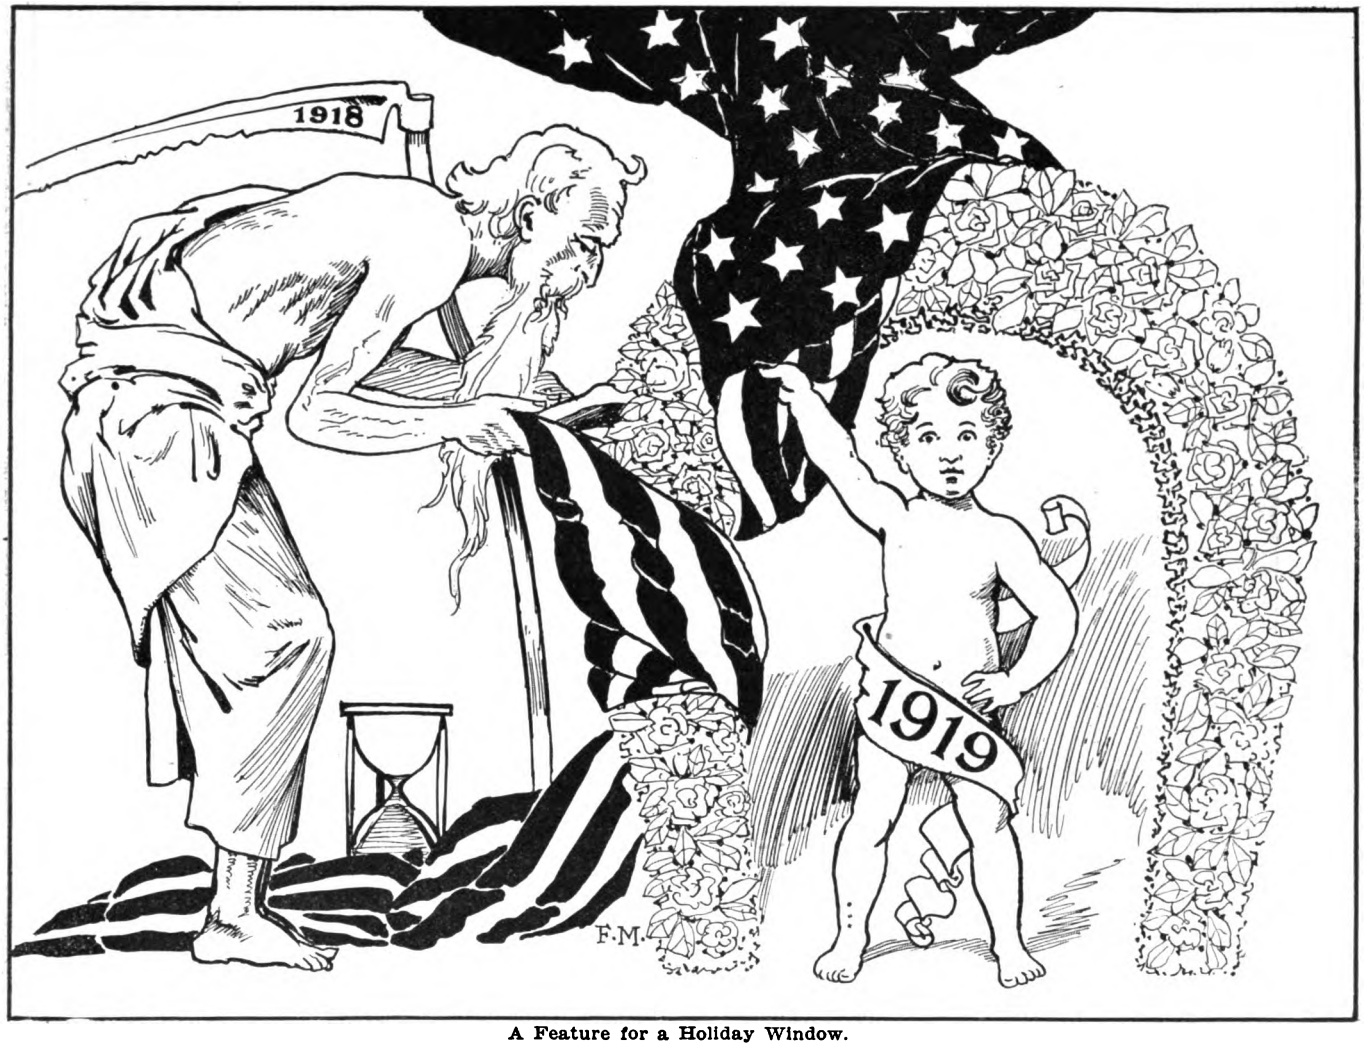
I was busy in my office one day in the old Times Building downtown, where I was in the habit of meeting many of the biggest advertising men of the day. In those old days an advertising specialist was a sort of a curiosity; the game was comparatively new and folks would come in from the West and South to see Mr. J.

Digitized by Google

Walter Thompson on the floor below, and they would also manage to get up to see me occasionally regarding copy. The best engraving at that time was done out of town—Philadelphia, for instance.

A man from that city came in one day and started in to talk engraving. I was a big user of photo engraving and was always a willing listener for any new stunts that were being put over. The young man unfortunately did not happen to be representing the right house. The work was inferior to what I was getting, and I frankly told him so, but he was insistent that his firm's work was better and went into details in a quiet way. He was a good talker, a convincing talker, and took away a good sized order.

It was not until he was gone that I suddenly came to the conclusion that he was absolutely personally magnetic. I knew his firm's work was not as good as what I'd been getting, and still the man had taken away an order, and I seemed willing to let him have it, and now that I come to think of it, I really believe if he had made a touch on me for a "ten spot" he could have had that, too.



I was in need of a good outside man at the time, so I came to the conclusion that he was going to be the man. I telegraphed him to come to see me at once on a matter of importance. He arrived in due season and I looked him over carefully and noticed for the first time that he needed a new suit of clothes, although he did have a shine on his shoes.

"Mr. Marvin," said I, "are you satisfied with the position you have in Philadelphia?" "Well, to tell you the truth, I am not," he replied, "although the folks over there seem to be satisfied with my work, but I'm only getting fifteen dollars a week."

I started this young man on twenty-five dollars a week, banking on a discovery—that he had that rare quality—personal magnetism.

He didn't know a thing about my end of the game, which was special advertising. I took him on a tour through the clothes and haberdashery shops down town, and the last stop, as I remember it, was Young's hat store right opposite the Times Building, in Nassau Street. High hats were common in those days during business hours, and I insisted that he looked good in a high hat, so he fell for it. I put a gold watch in his pocket, because as I told him, "you're going to meet some big people and you'll feel just as big as the other fellow if you've got some of this junk hanging on your frame."

We came back to the office, and as I had nothing very special prepared for him to show at the moment, I picked up a trade journal lying near at hand and tore out a page

A Feature for a Holiday Window.

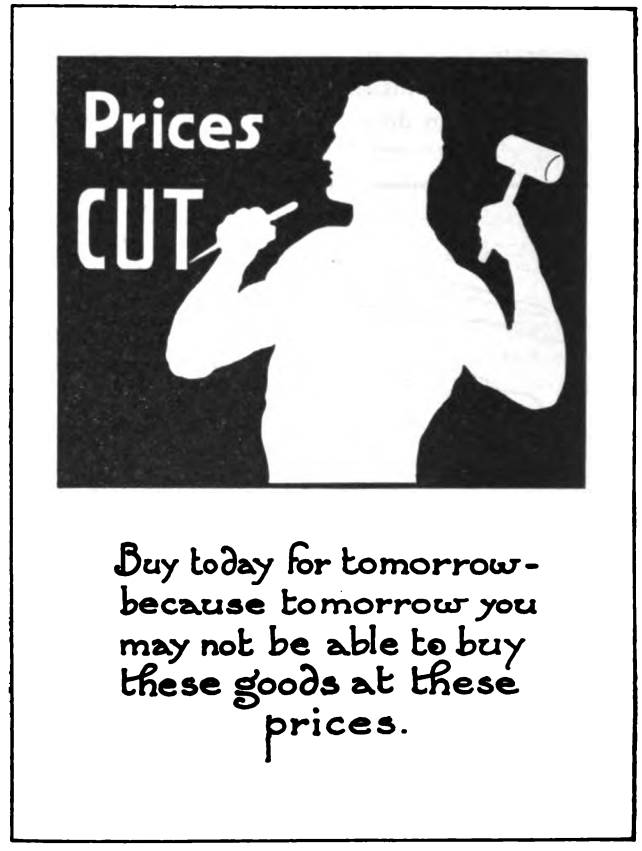
Digitized by Google

advertisement that was carrying matter on shoes. It was a pictorial page, so I had the tip right there—that the house was probably a live wire for illustrated ad "stunts."

"Go up and see this man, Mr. Marvin," says I, and—just then an idea for a shoe booklet popped into my head, so I said: "Wait a minute; I'll sketch out a booklet in rough layout form and it will give you an introductory talking point." I finished the layout and passed it over to him "for better or for worse."

He started towards the door and I noticed his every move till he got in the elevator—no affectation, no braggadocio, no feeling that he was dressed up; why, the man looked as though he had worn and had good things all his life instead of going around as an apparent misfit. Anyhow, he didn't miss the fit he had in that suit of clothes. He was gone about five hours, although the man he was to see was only about six blocks away from the office.

I began in my mind to say good-bye to the one hundred odd plunks I'd blown in on the gentleman's front, inasmuch as I hadn't even asked him for references. He



looked good to me and I was always willing to take a chance.

I was getting restless, and was just about to go over and have a chat with the late Joe Howard, the newspaper man, across the hall, when in popped Marvin.

"I met one of the finest gentlemen you'd want to talk to." That's the way he started, and then he went on to tell about how long the man had been in business and about the man's son and about their wonderful line of stock, and then again about the man, the old gentleman himself, what a fine man he was.

"I believe you, Marvin. I believe all you say, implicitly, but did he give you a look-in on any business?"

"Oh, that's all right," says Marvin, "I've got an eight

thousand dollar contract for advertising on all the Brooklyn car lines, but you'll have to come with me to-morrow to see this fine man and have the contract fixed."

At that time this was the largest order I had ever taken, and I nearly dropped dead. We talked over things for about an hour; I had forgotten all about the booklet layout I had given him.

He was looking over some papers and things he had taken from his pocket until he ran up against the booklet. He put it over to the side carefully with the remark that "they would like to have one hundred thousand of these little booklets as soon as possible."

Later on in the day, as we neared quitting time, he had the cheek to say to me in the most ordinary way possible: "Is what I've done to-day any good?"

I assured him that he was *IT*.

I asked him if he knew that he possessed personal magnetism. He said that no one had ever mentioned the fact to him. To cut a long story short—he was so good I took him in partnership.

This young man's secret, if it was not personal magnetism, was surely unlimited enthusiasm with and a great liking for his fellow-man.

Taken From a Mechanic's Note Book

Let Us Open the Memorandum Book of a Repair Man and Read What Dame Experience Has Taught Him.

BY J. FRED GILMAN

HEIGH-HO-HUM! December is here. The month of memories, of gifts, of Christmas and plum pudding. It marks the passing of BVD'S and other flimsy furnishings and the advent of sheep-lined lingerie and coal bills. Even if the war is over, the battle cry of "Feed 'Em" is becoming more and more of a problem every day, and America is, after all, the only real land of plenty in this hungry old world. It seems only yesterday that we were looking at the thermometer to see how hot it was, and here we are taking another look to see how cold it is. Which reminds us of the fellow convalescing from an automobile accident who said he knew he was going to have a smash-up, for his brakes wouldn't hold. When he was asked why he didn't jump before the wreck occurred, he said before he could pick out a good place to jump he had gone by it, upon which we will open our note book.

* * *

Cleanliness in the Open and Closed Car.

To clean the automobile properly is one of the most important things for the owner to know, for the longevity of the car depends to a great extent upon how carefully this is done.

Dirt is a great little destroyer of polished surfaces and of machinery, and the automobile is composed of both. You, of course, have heard of the Gold Dust Twins, but have you heard of the Gloom Twins (Dust and Dirt)? These two gloomy twins, like the modern cootie on the doughboy, put in their deadliest work on the body and running gear (of the car), and they devour paint, enamel and varnish. BUT, it is easy to remove them—provided you do it right.

There are several ways of removing dust and mud. One is to use water. The other, which is newer and much better, is to spray the dirty surface with a special preparation which softens the hardened dirt, and it is then wiped off with a cloth which takes the dirt with it.

If you use water, be sure to use it plentifully, especially if the car is clotted with mud. Any attempt to remove mud before it is thoroughly softened will damage the finish of the car. In using the hose be sure to remove the nozzle and flow the water over every part of the body. This serves to wash off as much of the dust as is possible and to loosen the mud so that in a little while it may be flowed off.

It is best to start at the bottom of the car and work upwards—in this way you clean the running gear, which is usually the muddiest—first and by gradually working upwards you avoid splashing muddy water on an already cleaned body. Use a soft, clean sponge and following it with the hose go lightly over the body. If portions of the body are grease spotted, they should be separately washed in pure water and castile soap, but never use a soft soap or a soap solution above the chassis. Never allow the water to dry off naturally on the bodywork, for should this happen your car will begin to take on the spotted appearance of a leopard.

Lastly, give the car a second quick rinsing over with the hose and, starting at the highest point with a piece of chamois, dry all the moisture from the body. If the engine is hot when you begin the drying process it is best to start with the hood to prevent the heat from drying it.

When grease and road oil collect on the chassis it requires more vigorous treatment and separate tools. An alkali soap is necessary, and is best made by dissolving a pound of soap (either soft or cake) in a gallon of warm water, and this preparation may be used to advantage on the chassis. A hard stream of water may be slanted against the wheel hubs but never directly against them for water will be washed into the bearings in this way.

Those that use the spray system for cleaning automobiles claim that by its use the danger resulting from a wholesale flooding of water is avoided and that the liquid preparation acts as a preservative for the varnish and enamel, which water does not. This spray method is much more convenient, requiring only the spraying of the car and then wiping it thoroughly with cheesecloth.

The automobile's upholstery should be daily brushed with a stiff whisk broom, and whenever possible a vacuum cleaner should be run up and down and into the cushions, which, by the way have a habit of absorbing the dust and dirt. A leather top should be wiped with a damp cloth, but be sure to dry it thoroughly before folding it down again, for should even the slightest trace of moisture remain you will find it covered with mildew when you go to put it up again.

Mohair cloth and other composition tops should be well brushed and occasionally beaten.

Slip covers if not kept clean will look worse than old upholstery and should receive frequent and special attention. Spots can be removed with gasoline, and beating from time to time, or better still treating them to a vacuum cleaner will make them add to the appearance of your car.

The best way to go about the cleaning of the closed car is to adopt the tailor or dry cleaner's methods. It is essential that the car be in a good light for it is almost impossible to accomplish anything like good results with

Digitized by Google

artificial light. The dirt should first be removed thoroughly from the seat cushions and upholstery and here again lies the value of the vacuum cleaner for the best results obtainable. Purchase the highest test or volatile naphtha or ether you can obtain, at the nearest drug store, for the low test gasoline which you purchase at a garage or service station may perhaps clean in a satisfactory manner, but the odor left will take many hours, even a day or two to disappear entirely, and there is the danger of leaving a ring mark upon the upholstery.

Use as little cleaner as possible, the less the better the finished job will be and the less chance of grease stains, the idea of this kind of cleaning being to loosen the dirt and grease so that much of it will adhere to the bristles of the scrubbing brush rather than soak into the upholstery which is being cleaned. Herein lies the reason for not using much gasoline nor attempting to do the work in a hurry.

Dip the brush in a pan of ether or naphtha and shake out most of it. Then start scrubbing the soiled seat or cushion, scrubbing on one side of the stain and working gradually towards the center. Work fast and scrub hard if you find it helps. In about half a minute you will notice that the bristles of the brush have become dry through the evaporation of the liquid.

Stop scrubbing and wash the brush carefully in a second pan. The amount of dirt collected will surprise you. Dip the brush in clean liquid, shake well and continue as before. Be careful in your hurry not to neglect washing the brush frequently, and be careful not to do too much scrubbing in one spot. It is much better to go over the entire area soiled and then permit the cushions to dry, in order to note if all the stains have been removed. After the portion scrubbed has dried a few spots or stains may show, but these can generally be removed after a second treatment.

It is always advisable in the case of velours to remove the dust with a vacuum cleaner and then smooth down the hairs with a piece of the same sort of material. Dust should never be allowed to collect around the pleats for a longer time than twenty-four hours. The cleaning of the car is not a difficult task. You have only to observe some of the few simple methods of the tailor.

The man who thinks that the varnish on his car is simply to make it nice and shiny is mistaken, for the primary function of the varnish is to protect the color underneath. The owner who would conserve the finish of his car and save expense by frequent repainting should see to it that this varnish skin is never broken and never allowed to wear through.

Ordinary washing and polishing will wear off the varnish in spots in about six months' time or a little more. So, Mr. Owner, to be on the safe side the car should be revarnished twice a year. Thusly the color underneath may be made to last for an indefinite period.

Do you know that only one car owner in ten understands the numerous details of his automobile? Of course they know how to start and stop it but when it develops mechanical trouble—blooy, there goes out upon the still air an S. O. S. call for a mechanic which sounds like a strickened liner that has just been submarined.

Don't laugh, reader, but just figure out where the shoe pinches most. Imagine, only the other day a fellow that told us, as his car was being towed to the garage, that he thought grease and oil were attended to by the makers of that particular machine and that he had only to fill it with gasoline. Our Editor can show you in his "Automobile Graveyard" a thousand instances such as this.

A lack of oil, and cooling troubles, are usually indicated by the engine missing, by knocks and a loss of power. These danger signals must not be ignored, for in fact a knock, however slight, is a forecast of troubles soon to occur and a thorough investigation should be made at once.

If oil contains grit or dirt of any sort, or if it is not clean, it will wear away the metal parts, the foreign matter acting as an abrasive. Oil contains a certain amount of gasoline, making it incapable of resisting the pressure between the rubbing surfaces.

The severest test of a lubricating oil is found in oiling the pistons and cylinder walls, especially at the end of the up stroke. At the moment of combustion the temperature is above 3000 degrees Fahrenheit and both pistons and cylinder walls are very hot, so it is very necessary to use an oil which will withstand this temperature without vaporizing or burning. If the oil is too thin or has a tendency to vaporize or burn, these high surfaces will not be properly lubricated and increased friction will result, and finally the friction between the two surfaces that ruin these parts.

The minute the sight feed of the oil reservoir indicates that the oil is not feeding fast enough the trouble should be located before the car is run further. Should this not be done there is great danger of the moving surfaces going dry and therefore becoming burnt out. Scored bearings will be the result if this feature is neglected.

The oil tank should be kept filled and one should be sure that the lubricating system is working at its maximum efficiency. If too little oil is used the car will suffer; if too much the oil will make the car smoke and then you are open to a summons to appear before the local court. It is a good plan to fill the oil reservoir at a certain time each day, so that there will be no chance of the car going dry.

Examination of cars in different parts of the country show that grease cups, gear boxes and differentials lack the attention due them, because the owner is a bit lazy and that these parts of the car are somewhat inaccessible.

True is the saying that "out of sight, out of mind," and many drivers still retain the impression that grease cups were placed upon the car for ornaments, but these drivers always pay for their neglect in the end because this inattention always results in the wearing out of these parts much faster than they should.

Freezing the Automobile To Death

If You Intend To Operate Your Car During the Winter, You Can't Afford to Miss This Article.

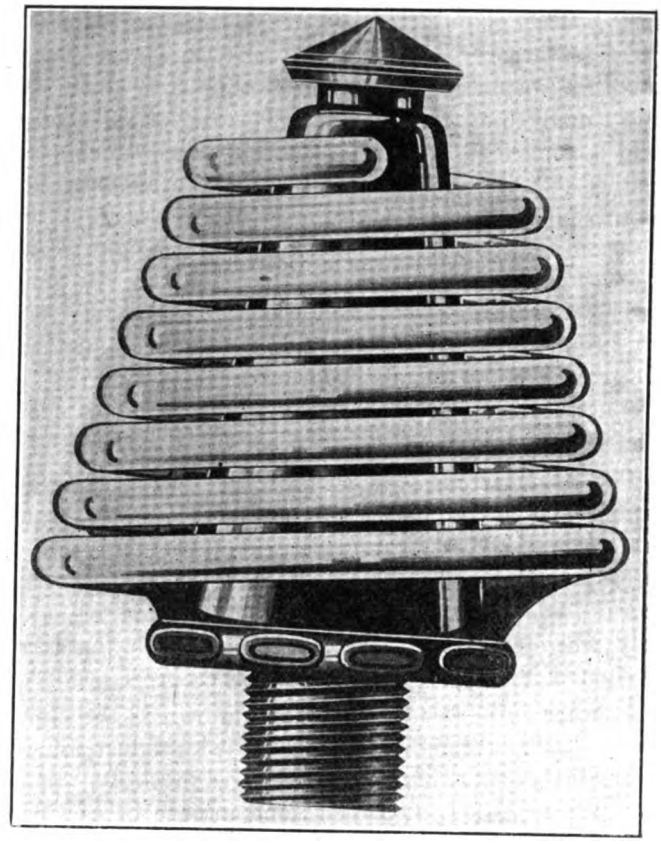
BY F. L. PHILLIPS

I SUPPOSE that there are many motorists who have carefully filled the radiators of their cars with an anti-freeze solution, have left their cars outside their houses for a few hours in zero weather, and have discovered that they needed a cylinder block or cylinder head, or possibly a new radiator.

If this hasn't happened to them, there is a possibility that they have gone into their garage some morning to find their radiator a mass of ice and the engine ruined. These motorists have immediately raised the question, "What can I do to prevent the cooling system from freezing? I carefully followed the directions which I found in a number of the magazines, mixed up the right preparations of alcohol and water, and yet here I am with a frozen engine. Evidently the magazines are not to be depended upon."

It is no wonder, then, that these motorists cease to place faith in signs and reading matter. As a matter of fact, however, they failed to realize that though in the beginning they followed directions and really did mix up the suitable anti-freeze solution, as time went along, their anti-freeze solution became nothing more or less than just plain water.

Combinations of alcohol and water, and alcohol, glycerine and water answer the purpose when they are first mixed. Many drivers place their confidence only in such liquids, and if these drivers "watch their step" they get through the winter with an undamaged machine.



Alcohol Evaporates Rapidly.

The one property of alcohol is that it will evaporate at a comparatively low temperature. The vaporizing point of this liquid is 173° Fahrenheit. Just tuck this little figure away in your brain somewhere, so that you will remember it, then listen to the following little facts about cars.

An automobile engine requires a certain amount of heat to be at its maximum efficiency. Though this point is between 200° and 300° Fahrenheit, manifestly it is impossible to obtain such a condition without boiling water, therefore a water-cooled engine will give the best results when the water is at a point between 170° and 190° Fahrenheit. If the temperature goes above this point, the water will be dissipated. Below this point the efficiency of the engine drops.

With this fact in mind, the manufacturers of the higher priced cars have equipped the cooling system of their machines with a thermostatic control. When the engine is started, the thermostat valve is closed and by-passes the water from the engine to the pump without admitting any of it to the radiator. When the temperature of this small body of water rises to about 180° the valve opens, and water passes through the radiator.

One can see, then, that the tendency of this control is to keep the water in the system very closely to 180°, or nearly 10° above that at which alcohol vaporizes. Now, I do not mean to say that all engines are fitted with thermostats, but many of them are, and though the thermostat is set at different points in different engines, the theory is the same, and in such engines an alcohol freezing solution quickly loses its alcohol content.

The Burke Condenser.

Of course, as soon as the alcohol is dissipated, the freezing point rises until eventually nothing but pure water is had, with its freezing point at 32° Fahrenheit. Now in any car a similar condition obtains. The cylinders fight with the radiator, so to speak; the cylinders heat the water, the radiator cools it. At any rate, the alcohol sooner or later is dissipated into the atmosphere unless some means is used to prevent it.

A Peculiar Device.

We take the liberty of reproducing in this article a picture of the Burke condenser, a device which deserves special mention because it is unique in this way. When

Digitized by Google

the alcohol is vaporized by the heat from the engine, vapor naturally rises and finds its way into the many coils of this condenser. Since the coils are exposed to the air, they present a large cooling surface and the alcohol is thereby condensed and drops back into the system, mingling with the water and preserving the alcohol.

The motorist who prefers to use an alcohol solution for his radiator should by all means adopt some such means as this to prevent the alcohol from being dissipated. The great reason why motorists, especially those of the old school, prefer the alcohol solution is because they know alcohol will not damage the radiator, the engine jacket, or the cooling system fittings. It does not have a chemical action upon any of the fittings, nor does it leave deposits in the jackets.

There is another argument which they often bring forth. They claim that some of the solutions which may be mixed are very apt to "find" leaks in the system. A small leak often will clog itself up with dirt or corrosion, and usually the leak will cease unless a strong alkali or acid is applied to it, when it again appears. Alcohol has neither acid nor alkaline action, and is preferred by many motorists for this reason.

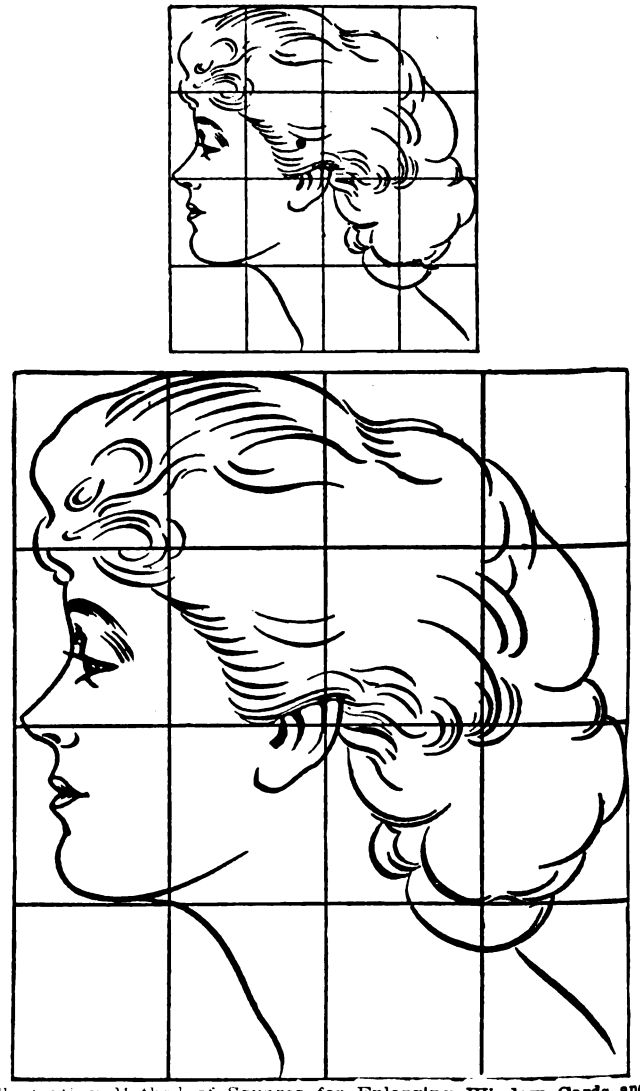
Anti-Freeze Solutions.

There are on the market, however, a number of standard products which may be mixed with the cooling liquid. One can make no mistake in using a nationally advertised product. In using such liquids, however, one should observe closely the directions of the manufacturers.

The manufacturers of Johnson's Freeze-proof preparation have guaranteed their product to give absolute protection to radiators at any temperature. This product is easy to use, and needs only to be once dissolved in the radiator water. Thereafter water need be added only when required. The freeze-proof solution is not dissipated, even at high engine temperatures.

Another anti-freeze combination, known as the Northwesco 1220, is a nationally advertised product and requires little or no time to prepare. With alcohol costing as much as it does at present, and in face of the many difficulties encountered by its use, the motorist surely should investigate such anti-freeze solutions.

There is no excuse for a driver to "freeze his car to death," nor is there any excuse for him to permit the solution to evaporate. A few minutes taken in looking after his machine every week amply repays him for the time he has spent.



If you like this magazine and feel that it is useful and interesting, the *one best way* to show your appreciation, is to purchase your accessories and supplies so far as possible from our advertisers. Also write to our advertisers for catalogs, printed matter and prices, not forgetting to always mention the fact that you saw the advertisement in the Automobile Dealer and Repairer.

THE SYSTEM OF SQUARES.

For Enlarging Pictures to Poster Size.

Note the two squared-off illustrations showing the young lady's head—the artist has made the larger one from the smaller, making his enlargement twice the size of the original.

Box in your picture by drawing a line entirely around it—then divide the box up into squares as per illustration No. 1. If you desire to enlarge a print to say three times the size of the original you have boxed in, simply advance the measurement to three times the width and three times the depth. Then divide the enlarged box, 2, into the same number of squares as contained in the original box.

Illustrating Method of Squares for Enlarging Window Cards and Designs from Our Illustrations.

Next draw the outlines of your original picture into the large squares just as you see them in the small squares, and you will find your proportions to be correct and your picture the size you desire for (in this particular instance, for illustrating the modus operandi) a display card.

For poster or window attraction size make your enlargement twenty times the size of your original print.

Putting a Piston In Its Place

How an Ohio Garageman Adjusts Bearings and Holds the Bolts While the Nuts Are Being Put Into Place

BY JAMES F. HOBART, M. E.

AFTER a rod bearing has been fitted to the crankshaft, how many times do you have to remove the cap bolts and take out or put in liners? If you have to remove the cap bolt nuts more than twice, then you are doing more work than is necessary and you should look about for an easier way. "Liners" ready cut to size may be had for most cars. These liners, the thin ones at least, made of brass, are of varying thicknesses from .002 of an inch up.

Recently the writer took notice while a garage man put in several pistons and adjusted the rod bearings thereof. The pistons, with rods attached, had been placed in a row upon the bench and were standing upon a piece of board which had been freshly planed. The workman selected the piston nearest to the coupling end of the crankshaft and slipped a couple of old bolts through holes in the coupling, then took a pry with a hammer handle between the bolts and revolved the crankshaft until that crank was uppermost where the piston was to be inserted.

He examined the piston carefully for particles of dirt, finding none, but he did find that one of the rings had been removed, from the second groove next to the rod end of the piston. A ring was lying on the board adjacent to the piston taken. The workman placed one side of this ring in the piston groove and then rolled the ring around the piston in the groove, to see that the ring was the right size.

Finding the ring a good fit in the groove, he presumed that the ring belonged there and proceeded to put the ring in place in its groove. He slipped the ring over the rod and let the ring slide down against the piston. Then he pressed the end of the piston against the cylinder housing, which had been placed upon a box during the overhauling of the engine. The workman then caught the end of the connecting rod against his body and thus held the piston between his body and the engine, leaving both hands free for manipulation of the ring.

Putting a Piston Ring in Place.

The thumbs and all the fingers of both hands were pressed against the ring, which expanded under the pressure and slid over the end of the piston. The ring was pushed easily and evenly along the piston until it came up against the first ring, which was in place in its groove. Then some of the fingers were used to compress the first ring, other fingers to slide the loose ring over the one in place, keeping the ring parallel at all times and taking care that one side did not slide ahead of the other side of the ring, thereby bringing undue strains upon it.

As the ring approached its groove, the workman took extra care to slide the ring evenly, so that when it finally slipped into its groove it went "all over and at once" and fell cleanly into the groove without any part of the ring having a chance to catch upon an edge of the groove and thus, perhaps, bring a twisting stress upon the ring.

The piston was pushed down evenly and squarely into its cylinder, and as ring after ring came against the end of the cylinder, the workman would press his fingers against the ring on either side, compressing the rings sufficiently to enable them to enter the cylinder without danger of damage to a corner of the ring. Some of the rings would slide right in, following up the slight bevel or chamfer with which the open end of each cylinder was finished, but if a ring did not at once slide in easily the workman put down his hands and compressed each ring as above described.

After the rings had been put in place, and before entering the piston into its cylinder, the workman covered

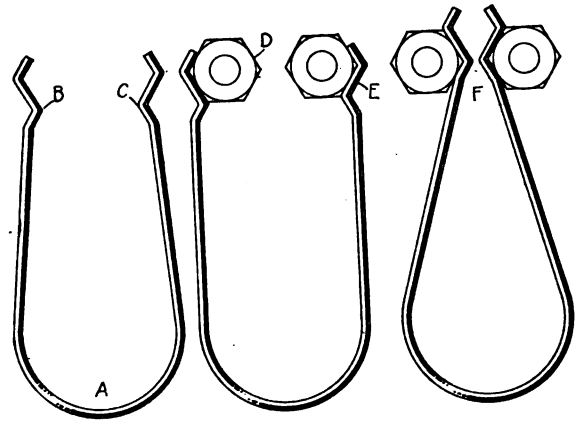

Fig. 1—A Handy Device for Holding Nuts.

both piston and rings liberally with oil, a squirt can filled with crankcase oil being kept handy for that purpose and a liberal portion was squirted into the cavities besides the several rings, after which the body of the piston was liberally covered with the oil, which was spread around by the fingers until all parts of the piston had been covered with it.

After the piston had passed far enough into its cylinder, the rod was straightened out and the bearing brought up against and under the crank, the friction of rings against the cylinder walls being sufficient to hold the piston at any part of its stroke. Some of the brass liners having been already put in place according to the workman's idea of how many would be required, the cap was put in place, and a bit of trouble met with right there, by the sliding down of the cap bolts, some of which would not stay up in place.

A bit of very thick grease was daubed upon the cap

Digitized by Google

bolts just below the head of each, with the idea that the thick "dope" would prevent the bolts from sliding down. This treatment held three of the bolts, but the fourth persisted in sliding down until the workman hunted out a tool shaped as shown at A, B and C, Fig. 1. This tool was made from a bit of steel tape about a quarter of an inch wide and less than a sixteenth thick.

The ends had been drawn down thin and pointed as shown at B and C, then the ends were bent as shown, in such a manner that they would not slip off of nuts whether applied thereto on the inside or on the outside as

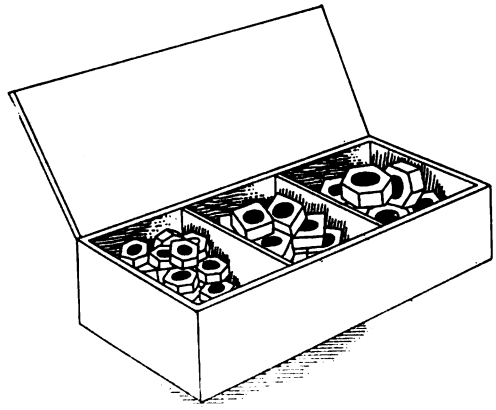

Fig. 2—Small Boxes Are Handy Nut Containers.

shown at D, E and F. When the bolts to be held chanced to be wide apart the clip was slipped over them, on the outside as shown at D and E, but when the bolts were near together the clip was slipped between them as shown at F, and in either case the stiffness of the clip, its spring, served to hold the bolts securely against their slipping out of place while the cap and the nuts were put on.

Adjusting the Caps.

The cap bolts stayed in place after a clip had been adjusted and the nuts were put in place, run down by the fingers, then given a few turns with a socket wrench, the end of which had been turned out for a "T" handle, five inches long, projecting equally on either side of the central rod of the wrench. The nuts were turned down evenly, the workman going around once lightly, then he set the nuts home as hard as he could turn with both hands on the wrench-handle.

A socket wrench with the handle bent over 90 degrees was then used and the castle cap nuts set home as snugly as a fair pull with one hand on the end of the 10-inch wrench would send the nuts. With a hammer the workman then struck a couple of blows fair on the end of each castle nut, to settle the bolt firmly into place, then the hammer was used to strike upon the cap, at the same time holding the fingers of the left hand against both bearing and crank and noting the vibration, the movement between the two, when the blows were struck.

Blows were also struck against either side of the cap, driving it in the direction of the crank length, the fingers being in place to detect any movement between crank and bearing as the blows were struck. During the several adjustments, watched by the writer, not quite enough liners had been inserted and the cap pinched the crankshaft so tightly that the liners were loose and there was no vibration between the cap and crankshaft when the test hammer blows were struck.

The cap bolt nuts were removed, a few more liners put in and the nuts replaced. This time the hammer test showed slight movement between the crankshaft and the cap, showing that too many liners had been introduced. Here the workman got his cue—before two liners had been introduced, the cap screwed down too tight. With two more liners in each side the cap was too tight and these two trials demonstrate that the limit of proper adjustment must be within that limit. Therefore, the cap bolts are removed, one liner .002 thick was taken from each side of the cap, then when the nuts were replaced and screwed home the hammer test showed a correct adjustment of the bearing for that connecting rod.

Inserting the Cotter Pins.

When the cap bolts are put in place, care is taken to have the cotter holes all point in the same direction, usually lengthwise with the crankshaft, then there is no time lost in looking for the holes when screwing the nuts into position with the holes uncovered. A standing rule with auto workers is to "Always note the direction of a cotter hole before applying the nut," then no time will be lost in leaving the nut at exactly the right angle. In the matter of crank cap bolts, the direction is fixed as above stated, therefore the nuts can always be squared with the length of crankshaft.

The workman struck the nuts a couple of light blows each, also tapped the caps back and forth lengthwise of the shaft before finally squaring the nut for the cotter. Then he selected pins enough for one cap and cut them to length with the wire-cutting pliers, tapped the cotters into place with the pliers, then bent the ends around with the same pliers, leaving the pins smoothly hammered into place with no ends sticking out to scratch fingers when feeling around in the crankcase.

Each of the pistons was put in place as described above, the rings put in place and the bearings, caps and bolts adjusted and the workman never removed the nuts but twice for each piston. If the first trial showed a loose bearing, the second trial showed a tight one, and vice versa, enabling the worker in either case to "pull a fit" without making but two trials, thus doing the work with a minimum time expenditure and obtaining a good fit quickly on each pison rod connection.

Duplicating Garage Tools.

Here is a very good example of the necessity for having plenty of tools in a garage, especially of the ordinary tools commonly used on nearly every car. The writer saw a man come from the far side of the garage, where he was working on a car, and hunt around the station of the man who was setting up the connecting rod bearings on the crankshaft.

Finally the searcher dug a pinch bar out from under

Digitized by Google

some of the car parts and carried the bar away to where he was at work. Soon another man came from still another part of the shop and began looking around on the floor. "Wot yer lookin' for, Bob?" "Pinch bar!" "Tom just came for it," said the man who was making up the crank bearings, and away went the third man seeking the pinch bar.

This is wrong. There should be pinch bars enough in the shop that each man could have one when he needs it without having to hunt the shop over for the tool. The amount of time spent each month, by each one of the men, would prove surprisingly large, could all that time be recorded and placed before you in a lump. And still more surprising would it be to you if you could see recorded the reason why each bit of time was thus lost.

Keep your eye on this matter a bit and you will very quickly, now your attention has been called to the matter, see that it will pay you to duplicate, triplicate and even quadruple some of the common tools in the shop tools, and that with only one each of the commonly used tools the men lose time enough to quickly pay more than the cost of supplying a number of duplicates of the tools so commonly used by all the men.

"Here, Sam; run to the drug store and get a nickel's worth of Fuller's earth," said the garage foreman to one of the workmen. "I haven't got a bit in the shop. Always intend to keep some for it is mighty good for brakes. A nickel's worth will last a long time and many a brake trouble can be cured by putting in a little Fuller's earth. It's no good on leather, but it sure works well where there is no leather surface."

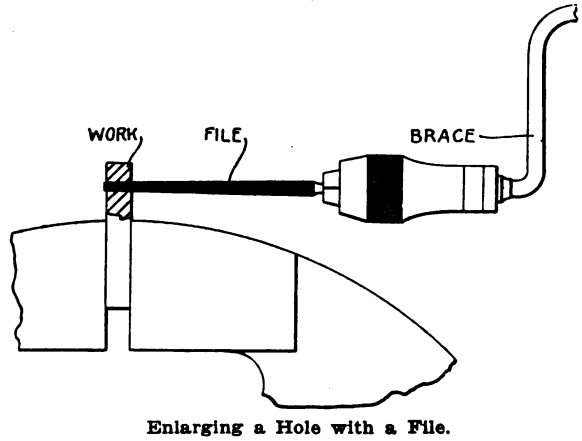
Nuts in a Cigar Box.

"When I remove nuts from bolts in taking down an automobile," said a garage worker, "I always make it a practice to put the nuts in a cigar box, divided as in Fig. 2. You can put the other parts in a larger box or spread them around on floor or bench, but I don't like nuts dumped into a box with the smaller parts of mechanism, where you have to hunt for the particular nut wanted.

"It is a nuisance to put each nut back on the bolt where it belongs as a whole lot of time is lost in doing that stunt. Besides, there are often cases where nuts cannot be put back in place without being in the way of other operations. But with all the nuts in a little old cigar box I can quickly select the nut needed without losing any time in hunting over a lot of other junk. Yes, I know that a cigar box soon goes to pieces but they cost nothing and a supply can always be on hand for the bringing home. I like the cigar box for nuts, better even than the tin boxes which some garage men provide—and try to keep for holding loose nuts which have been removed from a machine."

A Lesson in Floor Sweeping.

Boys are having their innings in garages nowadays and it is no strange sight to see ten-year-old boys working around a garage during vacation time or after school hours, especially when "one session" is the rule in their school. One boy got a lesson in floor sweeping which should redound to his credit. The garage owner had provided, instead of brooms, short-fiber bristle brushes with handles attached in such a manner that the brush should be pushed along the floor, driving the dirt before the brush.



With use the short bristles became bent over and the boy was seen to be pulling the brush as though it was a hoe. The owner soon relieved the boy and made the brush work well again even though the bristles had been bent over. He bored a hole for the handle from the other side of the brush so the boy could still push the brush before him, but the head of the brush having been reversed, the fibers again pushed the dirt before them, instead of sliding over it as they did when they worked with the bend of the fiber instead of against it.

"Cheaper than brooms," the garage man told the writer, and the brushes, which were about 20 inches long, did, it was claimed, much faster and better work than could be accomplished with brooms, and furthermore prevented that "fanning" of the dirt and dust which is so frequently the practice of the inexperienced sweeper, and which is sometimes done by those who well know that dirt "should be drawn but never pushed or flirted into the air!"

REAMING WITH A ROUND FILE.

By CHAS. E. DURYEA.

TRYING to enlarge a hole with the point of a round file is often annoying, since the file wedges if pushed in too far and comes out if the strokes are not annoyingly short. If a bit brace is at hand, as illustrated, grip the file tang with it and use like a left-hand reamer. Do not force too hard, since this is likely to break the teeth. Remove frequently to drop out the chips, as files have but little clearance. The file feeds in if turned to the right and sticks and breaks.

Enlarging a Hole with a File.

ACCORDING to the report of the National Highways Protective Association, the death toll of automobiles for November, 1918, is far above the total for the same month last year. In New York State alone, 131 persons were killed by automobiles this year, as against only 81 during November, 1917.

It is time for us to ask ourselves why the accidents continue to increase in number. We cannot answer by saying that the increase is due to the increased number of cars in use, for the statement would be untrue. The number of cars owned in 1918 was not 100 per cent more than those owned in 1917. Something is wrong, either with the operators or with the laws.

If we analyze the causes for the various accidents, in at least 90 per cent of the cases, we find that carelessness can be blamed. Obviously it is impossible for the officers of the law to be stationed at every crossroad in the country, and upon every street. The autoist himself is the person who should be dependable enough and not need a guardian.

Taken as a body, the automobile drivers in this country should be able to control their lawless members. It is a case of being their brothers' keeper. The automobilist who knows that his neighbor is a careless driver should take it upon himself to interview that neighbor and see that the neighbor is controlled. It may be the means of saving his own life or the lives of those in his family. It's up to every reader to do his part in controlling the careless ones of the country.

Girl Mortally Hurt: A 14 year old girl of Freehold, New Jersey, a short time ago received internal injuries and a number of bad fractures which may result in her death, when she was run over by an automobile. The girl was scrambling up a bank by the roadside when the car ran her down. Evidently the driver was "green," and, in trying to avoid her, steered his machine up the bank and over her.

Careless on Corner: At Newark, N. J., early last week, a peculiar accident occurred. A taxicab was being driven at a rather slow rate along the street when the driver suddenly decided to turn sharply to the left into an intersecting street. At that moment the driver of a machine behind him tried to pass. However, the taxicab swerved so sharply that the rear car collided with it. Both machines were overturned and badly wrecked. The driver of the car in the rear was killed. This was a case where the taxicab driver should have held out his hand to warn the machine in the rear.

Engine Left Running: The driver of a truck owned by a large department store of Brooklyn left his seat to deliver goods, and failed to stop the engine. A boy climbed to the seat, engaged the clutch, and the truck started, throwing the boy beneath the wheels. The driver came out of the house just as the boy fell, and ran some distance before he was able to overtake and stop the truck.

Driver Hits Two: A young man who had just been served with a summons for speeding his father's automobile, badly injured two people in Brooklyn early this month. This driver did not even hold an automobile driver's license.

Driving on Wrong Side of the Street: An automobile being driven at 40 miles an hour on the wrong side of the street struck five sisters of Chicago, killed one and badly injured the others. The occupants of the car abandoned their machine and ran away, but were arrested later. It is claimed that all of the occupants were under the influence of liquor.

Youthful Driver Kills Child: A sixteen year old chauffeur of St. Paul drove his machine upon the sidewalk and pinned a little girl against the wall of a building. It is claimed that the driver had been driving his car recklessly, had hit a number of other cars, and evidently lost control of his own machine when the accident occurred.

Car Skids and Hurts Seven: A short time ago, a heavy car, operated at excessive speed, while making a turn, skidded on the wet pavement of a New York street and crashed into a crowd of men and women on a sidewalk. Two of the people suffered fractures of the skull and are not expected to recover.

Bled to Death: A prominent business man of New York recently died from a very peculiar automobile accident. The car in which he was riding was damaged in a collision, and fragments of the broken windshield cut the victim's face, as well as some of the other occupants of the car. The victim did not realize that he was badly injured, but his chauffeur noted that what appeared to be a superficial cut on his neck was bleeding profusely. Upon noting this, he drove to the nearest police station, where it was found that his jugular vein had been cut. The flow of blood could not be stopped, and he died shortly after his arrival at the station house.

Sometimes the Worm Turns: This heading appeared in a Pittsburg paper, and the article beneath tells of a case where an Italian was arraigned charged with reckless driving—not an automobile, but a horse and wagon, which had crashed into an automobile.

Motor Truck Causes Flood: A motor truck in Philadelphia, a short time ago, was the cause of a miniature flood on Second and Market Streets. The machine was driven into a fire hydrant, breaking it off and flooding both the street and the cellar of a cigar dealer with water.

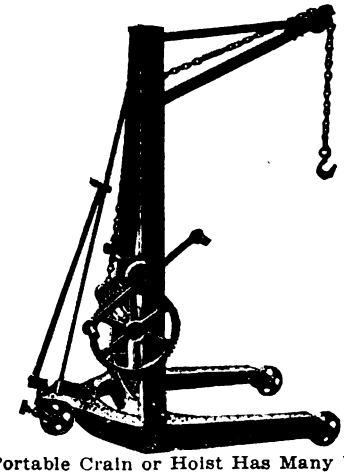
Practical Repair Shop Equipment

If the Garageman Is Not Careful When Purchasing Tools, He Will Find That He Owns a Few "White Elephants."

BY F. L. ALLEN

NOT long ago a friend of mine decided that he would start a small garage and repair shop, and came to me for advice. As far as I could find out, this friend was limited in most everything but nerve. He didn't know much about equipment, he didn't have much money, and though he knew but little about automobiles, he had located an excellent mechanic.

As I said, this friend had plenty of the essential nerve,

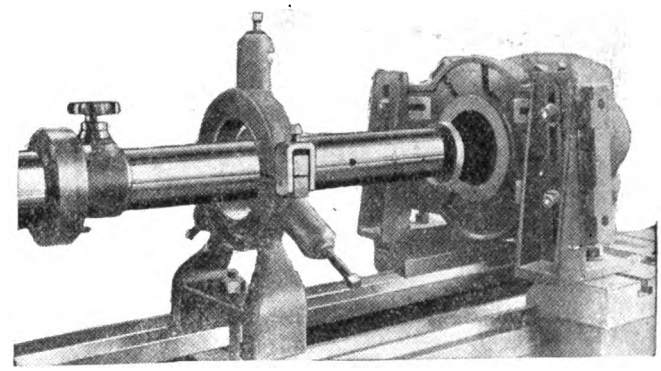


"I'd Surely Have a Set of Socket Wrenches."

and that being the case, he decided that all he wanted was the machinery. So it was that he asked my opinion as to equipment, and thinking perhaps the same advice might come in handy for others, I venture to set it forth in an article.

I once visited a garage which boasted as equipment two hammers and a set of socket wrenches, reinforced by three screwdrivers and a crowbar. Work that could not be done with a hammer would yield beneath the crowbar. If I remember correctly, I think the man in charge possessed a jack-knife as well.

He could always obtain work, provided he could but-



A Portable Crain or Hoist Has Many Uses.

tonhole the repairee and switch him into the office; but he couldn't always keep a steady customer.

This repair man represented one extreme. Later I made a tour of a service station where one could find everything from a cotter-pin puller to an electric hoist. Perhaps the men in the second shop could do better and more work than those in the first, but they nearly ruined my new machine, and so I am in doubt. One of the workmen made the following remark to me which effectually disposes of the overequipped shop as a practical thing:

"They've got whirligigs for twisting the nuts up quick; wrenches for reaching the hidden nuts in an inverted, double-jointed combination L, T, and I-head motor; big presses for flywheels; small presses for magneto shafts; offset, underset, overset, and all kinds of set screwdrivers and bolt removers; but I'll be derned if can ever find a monkeywrench or hammer when I want it."

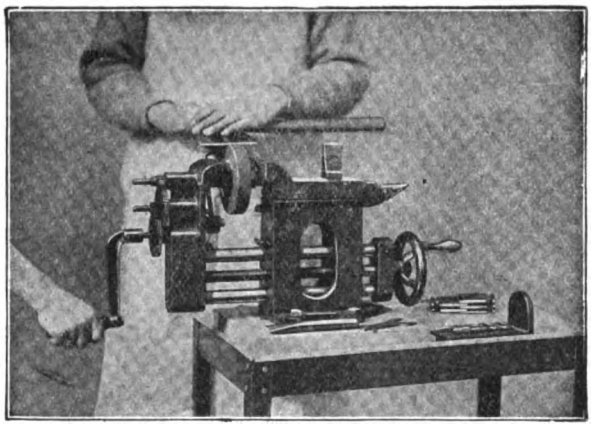
If I were equipping a garage, I'm sure I would try to steer a path just between the two extremes. The first thing I would buy would be a good set of socket wrenches: one of those sets that have a ratchet handle and universal joint attachment with an extension bar. With such a set in my overalls pocket I could guarantee

A Cylinder Grinder Is Almost a Necessity.

that my customers wouldn't kick because I had destroyed every blamed nut on their machine. But, believe me! I'd keep that set in my pocket or under lock and key if I had many visitors, or I'd be afraid that they would develop legs and walk away.

There are many repairmen that don't need to buy jacks, hammers, cold-chisels and such small tools, especially if the cars which they repair are fully equipped with tool kits. Still I would suggest that such tools be purchased, they're mighty handy in some cases. I don't want to go into the small tools equipment, it will take too much space; such tools can usually be purchased "round the corner" in the hardware shop when they are found necessary.

Next I would look around for a small lathe. I wouldn't care for one so large that it would fill the shop, but buy one that could be used for screw-cutting and general repair work. Any machine that would take in a diameter of 14 inches would suit, especially if there was a



Digitized by Google

machine shop in town to which I could take extra large work. I would want a lathe of the hollow spindle type, if I could afford it, and able to turn a shaft at least four feet in length.

In my mind, a screw-cutting lathe is the most important tool in a shop, and I'll tell you why I know this. On a lathe an ordinary machinist can do any job from splining and turning shafts to gear cutting. As time goes on, a garageman who owns one of these lathes can add to his equipment by purchasing different attachments for milling, splining, gear-cutting or tapping.

On this lathe one could grind or bore cylinders as well. Still, if much grinding or cylinder boring is to be done, a special machine for such work should be purchased.

Of course the lathe and other tools would have to be driven by an engine or motor. I would suggest an electric motor for this purpose and one that is about two times larger than I needed at first; that is, if I bought

The More Adaptable the Vise the Better the Investment.

it outright. If I hired a motor, of course I wouldn't get one too large for present demands.

As soon as one begins to make money, one can find ways for spending it. There are many power-driven machines for saving time, and if my motor were not large enough to take care of more machines than the lathe, it would be a dead investment. Always leave room for growth and plan upon plenty of power; you'll need it.

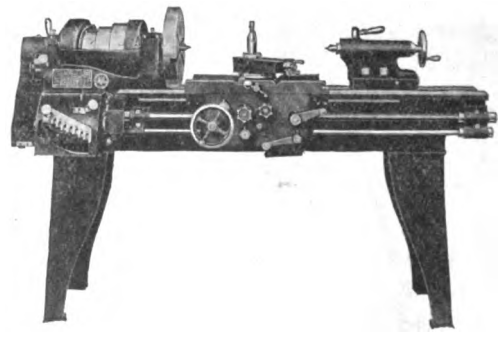
No repair shop is complete without a grinder, but, for goodness' sake, don't mount the grinding wheel on the lathe. I did that little trick once and nearly ruined the machine: the emery gets into everything and sooner or later the lathe is almost valueless. Mount the grinding wheel, or wheels, in the opposite corner of the shop, away from the lathe, but near a window.

With the grinding wheel outfit I would get one of those patented attachments for sharpening twist drills, then I could resurface valves, if necessary, simply by making a thimble or sleeve for the valve stem that would fit the drill-grinding jig.

If I couldn't afford the grinder, and had to make one myself, I should purchase a valve-grinding tool. I would also buy a valve reseating machine; it would pay for itself in a short time.

I should expect to do a lot of bearing reaming and replacement, and consequently would get a set of adjustable reamers. One adjustable reamer is so flexible that it

A Chain Drill Is Mighty Handy.



could be used for many sizes of holes and therefore would be worth four or five ordinary straight reamers.

If my capital warranted and I were sure of lots of main bearing repair work, I would purchase a main bearing reamer—one of the kind that will ream all of the main and connecting-rod bearings at one time. With such a tool an ordinary mechanic can do a job in an hour that would take an expert half a day to accomplish by the old scraping method.

Next to bearing repairs, an engine usually requires regrinding. The cylinders, with present-day fuel, seem to work out of shape very quickly. Therefore I am sure that a cylinder grinding or reboring machine would be the next tool to consider.

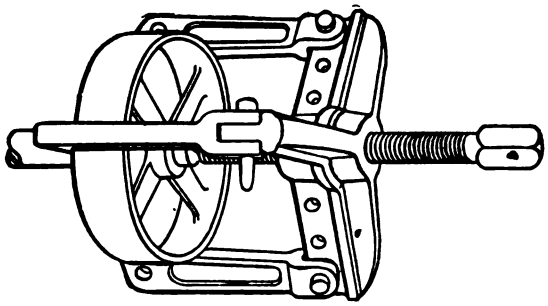
There are two tools that I would find it hard to choose between: a portable engine stand, and an arbor press. Both of them seem so necessary that I'm afraid I would be tempted to buy them both, even if I had to mortgage the shop. A mechanic can't do good work while he is standing on his head, therefore an engine stand would insure a saving of time. A sledgehammer is a mighty poor tool for driving off flywheels, and so I would buy a press.

For a while I suppose I would buy the babbitt bearings from the service station, or the manufacturer; but I doubt if I would be content at losing the profit. Sooner

First Buy a Screw-Cutting Lathe.

or later I would learn to pour the bearings myself, but I would practice on my own machine before I made bearings for my customers.

One of the tools that I have found most indispensable is a portable drill or chain drill. When one puts a car



Digitized by Google

together again, one invariably finds that a hole must be bored in the frame of the car. One can use a brace and bit for the job, but I prefer to reduce weight by going on a diet, rather than by sweating it off.

In regard to such a portable drill, I know of a flexible shaft arrangement that can be fitted with a drill, an emery wheel or a buffer, and I would send for it post-haste, for it could be used for so many little jobs in the garage.

At this point I find, upon adding up the total, that I have spent all of my friend's money; perhaps you, too, are at the end of your resources; if not, let's keep on spending.

In many cities the fire insurance laws prohibit the building of garages with pits, and the repair man is obliged to lie on his back beneath the car while making repairs. If I did not have a pit in my garage I would purchase a movable crane; then I could lift the front or back of a machine, lift out an engine, or a transmission, and not require the help of half a dozen husky workmen to do the lifting. I would see that the crane was fitted

"A Hundred Percent Better Than a Hammer for Pulling Gears and Wheels."

with roller casters so that an engine or power plant could be carried in it to any part of the shop.

With sufficient money at my disposal I would purchase a drill press, or upright drill—a tool that would make me independent of any outside machine work, providing my lathe were big enough. Milling and special attachments that I could not use on my lathe, I could use on the drill, and so I would feel that my equipment could take care of any or all automobile jobs that might come into the shop.

THE EMPTY SLEEVE.

There were five of us in the smoking compartment of a train en route from Washington to New York. Two were soldiers who, it developed, had recently come from overseas. As we slowed up at Wilmington the blare of a brass band playing a patriotic air came from in front of the shipbuilding plant on the immediate river front. One of the civilian passengers joined the soldiers at the window.

"That's the way to do it," he said with enthusiasm. "See that great crowd of workmen. Those are the boys who made possible the winning of the war."

The soldiers glanced contemplatively at the crowd but made no comment.

The other civilian, an elderly man with the appearance of a merchant, or possibly a lawyer, asked mildly:

"What is the present wage scale for expert workmen, I wonder? I think I read in this morning's paper that some men somewhere were striking for an increase to a dollar an hour with overtime above eight hours."

The soldier nearest the window turned.

"I read that too, sir," he said respectfully, "and it's hard to believe. We got a dollar a day over there, and all the shells the huns wanted to fire at us. This talk about big money in the factories here and the men laying down for more didn't listen good to us, eh, Jack?"

The other soldier nodded.

"I wonder what the boys in the plant over Easton way are going to say to me when I get back on the job?" he replied, shifting his position.

It was then we noticed that his left sleeve was empty. —From Industry.

FROM ONE OF OUR BOYS IN FRANCE.

One of the boys in our office, Lawrence E. Ross, who was with us for several years, has been in France and is connected with the 309th Heavy Field Artillery. In a letter which we received recently, evidently written before the armistice was declared, he writes:

"Just a few lines to say that I am enjoying the best of health and also enjoying the excitement on the battle front. I am proud to say that I am connected with the first regiment of heavy field artillery that the National Army has turned out.

We surely are raising merry h—ll with the huns, and you can bet that they wish they hadn't started anything with good old Uncle Sam. We have some great air battles, and it was only yesterday, while we were at lunch, that tricky Fritz stole over the lines and tried to nip our observation balloon. Well we surely did welcome him with our machine guns and rifles, and I am glad to state that we brought him down before he reached the balloon. It was surely exciting. We found the aviator was a boy of 18 years of age and he had been shot five times.

He died a few minutes after landing. When we start to give the hun a good shelling he usually sends over a gas attack, but the good gas masks supplied by Uncle Sam protect us from all the gases the hun can send over. It is nothing to have to keep the mask on from five to eight hours at a stretch, but when one knows his life is at stake, one hates to take the chance of taking it off even then."

When someone wants to put a Red Cross or Y. M. C. A. war poster in your window, smile and help, instead of frowning and objecting.

Tractor Experiences In Illinois

Although Still In Process of Development, the Gas Tractor Has Proved Valuable Under Many Conditions

BY ARNOLD P. YERKES and L. M. CHURCH

PROBABLY the most significant difference between the reports received from tractor owners in 1917-18 and those received in 1916 is the much larger percentage of men who report that the tractor has proved a profitable investment. In 1916 less than 80 per cent. while in 1917-18, 90 per cent., or 9 out of 10 men, made such reports. This is partly due to improvements in the tractor, and partly, of course, to the increased prices commanded by both farm products and farm labor during the past year. In this connection, however, it should also be noted that while at the beginning of 1916 a considerable number of the large old-model tractors were still in use, by the end of 1917 practically all of these had been discarded, and the reports on which this summary are based deal almost without exception with the small or medium-sized tractors developed during the last three or four years, which not only cost less in the first place, but give every indication of having a longer life and lower repair charges than the older models.

Another significant difference between 1918 and 1916 is the increase in the percentage of three-plow outfits and the decrease in the percentage of two-plow outfits in use, which is in keeping with the opinions of tractor owners set forth in Farmers' Bulletin 719, to the effect that the two-plow outfit is not large enough for the average corn-belt farm, and that the three-plow or four-plow machines are better adapted to conditions in Illinois.

Nearly three-fourths of all the tractors in Illinois on which reports were received in 1917-18 were pulling three plows, while more than three times as many two-plow as four-plow machines were in use.

Size of Farm and Tractor.

Though the introduction of an improved farm machine may be expected to reduce the man labor required for farm operations, thus permitting one man to accomplish more work and so farm more land than with the older methods, a farm business must be of sufficient size to permit the economical use of an improved machine in order to justify the necessary investment. That is, many small farms must either use the old methods or hire a modern outfit, because the small amount of work to be done each year does not warrant owning the machine.

Among the more important facts disclosed by a study of the use of the tractor for farm work are those relating to the increase in the acreage which can be farmed by one man when a tractor is used in connection with horses, over that farmed with horses alone. Approximately one-third of all the Illinois farmers reporting increased the acreage they were farming after purchasing a machine, the percentage of men so doing being slightly higher in the group reporting the tractor profitable. The percentage of the entire number of tractor owners who have enlarged their farms is significant, for whereas there has been a tendency for the size of corn-belt farms to increase in recent years, the increase among farms in general is not nearly as pronounced as in the case of farms on which tractors are used.

It is doubtless as a result of the more general use of the three and four-plow machines, and hence a better acquaintance on the part of farmers with these sizes, that 76 per cent. of all owners reporting recommend the three-plow machines, while 13 per cent. favor the four-plow outfit, and only 11 per cent. advise a two-plow rig, whereas, at the time the data on which Farmers' Bulletin 719 was based were collected (1916), a somewhat greater percentage of owners recommended the four-plow than the three-plow outfit, with 13 per cent. advising the two-plow rig. At present there seems to be no doubt that the three-plow size is the general favorite for corn-belt conditions, whereas the four-plow is more generally preferred than the two-plow size.

Even on farms of comparatively small size the three-plow tractor is recommended by the largest percentage of owners. This, taken with the other facts, seems to indicate that the two-plow tractor does not increase sufficiently the amount of work which one man can do, hence does not posess, except to a slight degree, the greatest advantage of tractors in general, namely, timeliness in performing farm operations through much more rapid work than is possible with horses. Moreover, a two-plow tractor does not ordinarily develop enough power to make it suitable for operating grain separators and ensilage cutters, tasks for which power is required on the average corn-belt farm. It happens not infrequently that the owner of a two-plow tractor has to hire an engine with slightly more power to do his belt work, so it is not to be wondered at that in case he were buying another machine he would select one with more power.

The question as to the smallest size of farm on which a tractor can be expected to prove profitable is one often asked and one that has been much discussed. Certainly no more reliable opinion on this point could be obtained than the average of the estimates of a large number of tractor owners. In the opinion of these men, the minimum number of acres on which two. three or four-plow outfits may be expected to prove profitable are 130, 170 and 210 acres, respectively.

Attention is called especially to the fact that these

Digitized by Google

figures represent the *smallest* size of farm for which these tractors should be purchased, in the opinion of men who have had experience with them, and not the size on which they can be used most profitably. A farmer who is contemplating the purchase of a tractor and whose farm is smaller than the acreages above given should consider carefully before acting contrary to the opinions of experienced men.

The average sizes of the farms reporting on which two, three or four-plow tractors are in actual use are considerably above the minimum figures given above, being 180, 250 and 300 acres, respectively.

The three and four-plow sizes seem to meet best the tractor requirements of the average farm in Illinois; they enable plowing to be performed much more rapidly than is usual when horses are employed. The man labor is also reduced when using these sizes of tractors, as one man attends to three or four plows at one time, instead of only two, as is ordinarily the case where horses are used. (Where modern self-lifting gang plows are used, one man ordinarily handles the entire outfit in plowing, no matter what size gang is used.) Furthermore, the four-plow size of tractor is generally powerful enough to operate practically all of the machines which are commonly found on the average farm, including the ensilage cutter and the medium-sized grain separator. At the same time it is not so expensive in operation as to prohibit its use for many odd jobs which do not demand a great deal of power.

Cost of Tractor Outfit.

The price which a farmer can afford to pay for a tractor for use on his farm depends upon a number of factors, such as the amount and value of the work which the machine will perform annually, the value of the horses which it will displace, the value of the man labor saved, and the amount of increased returns which reasonably may be expected from its use.

The prices for both tractors and the implements for use with them have been considerably increased during the last two years, owing to the advances in costs of both labor and materials required to produce them. The prices paid for the three sizes most commonly bought during 1917 on the Illinois farms reporting average about $800 for the two-plow, $1,100 for the three-plow and $1,400 for the four-plow machine, while the prices for the plows for use with them average about $115, $165 and $235, respectively. In all cases the prices, of course, varied considerably according to the make and quality of the machines. At the beginning of 1918 there was a further general and substantial increase in prices.

Life of the Tractor.

It is obviously impossible to determine definitely the probable life of the latest model tractors, since none of them has been worn out, but the nearest approximation to the actual figure would unquestionably be the average of the estimates given by a large number of men who had used them for a season or two. Tractor owners were asked for an opinion as to the number of years their own particular machines would give satisfactory service, and also to give an estimate of the average life of farm tractors. The replies to these questions showed a tendency on the part of men who reported the tractor as having been profitable to estimate that their own machines would last somewhat longer than the average machine. On the other hand, men reporting them unprofitable usually gave the probable life of their machines as less than their estimate of the average life of tractors in general. The answers to both questions, however, averaged very nearly the same, being eight and seven and one-half years, respectively.

Of course, these averages cannot be regarded as being absolutely accurate, but certainly they should be as nearly accurate as any figures which could be obtained in any other manner at the present time. As a matter of fact there would probably be a tendency on the part of tractor owners to overestimate somewhat. It is not believed, however, that a prospective purchaser of a tractor should expect for his outfit a longer life than seven and one-half seasons, and he would be on the safe side if he counted on a somewhat shorter period of service when calculating the probable value of a tractor for his work.

Days Used Annually.

The life of a tractor cannot be expressed definitely in terms of years, since the number of years it will last will depend upon the amount of work done each year; that is, the number of days or hours it is used. This varies on different farms, according to size, type and system followed, the average for tractors in Illinois being 45 days per year.

While at first glance this may appear low, when it is remembered that on farms where horses do all the work they are used on an average of only about 100 days annually, it will be seen that where both horses and tractor are used, even though the number of horses is somewhat reduced, the machine need not be expected to have employment for as many days annually as did the horses. The horses kept will still do some of the work, which will, of course, decrease the amount to be done by the tractor. A considerable percentage of the 100 days' work done by horses represents odd jobs for which the tractor cannot be used to advantage. Even if the machine were to do all the work formerly done by the horses it would not normally be employed 100 days per year, inasmuch as it does the work more rapidly.

Practically all farm operations must be carried on within limited periods, and between these seasons there will often be no field work that the tractor can do, either on the home farm or for neighbors. The fact that weather and soil conditions are such as to permit field work with a tractor does not necessarily mean that there is such work to be done. Farm management plays an

Digitized by Google

important part in organizing the farm so as to provide profitable employment for the tractor during as many days as possible. Such organization involves the planning of a crop rotation which will furnish a large amount of work which it can do, the elimination of as many horses as desirable, and the distribution of the work over a long period. However, the rotation should include only such crops as can be grown profitably in that particular section.

Expense for Repairs.

Of 140 tractor owners in Illinois who had used their outfits one season or less (average age 9 months), 48 reported that they had spent nothing for repairs. The others had repair bills varying from a few cents to a hundred dollars or more, the average being $22, making the average repairs for the entire group about $15. Comparatively few machines go through their second season without repair charges. The average repairs for 158 Illinois outfits between the ages of 13 and 24 months (average age 20 months) was $39. For 34 machines between the ages of 25 and 36 months (average age 32 months), the average repairs amounted to $79.

It is impossible at present to state definitely just what effect the size of tractor has upon the repair bills. The figures thus far obtained would seem to indicate that the percentage of the first cost required annually for repairs is somewhat lower for the four-plow size than for the smaller outfits, but this may be due to the fact that there are more cheaply constructed and low-priced outfits among the smaller sizes than among the four-plow machines. It is impossible as yet to make any definite statement as to the annual repairs required by high-priced machines as compared with lower-priced ones of the same capacity. The figures seem to indicate that repairs are somewhat lower for the high-priced machines, but there is not enough difference to justify a positive statement to this effect.

The figures given would indicate an annual repair charge during the first three years of a tractor's life of about 3 per cent. of the first cost, but this would undoubtedly increase during the latter years of its life, as is the case with most other machines. It would not seem safe to expect the cost of repairs for a tractor to average less than that for other farm machines, which is a little over 4 per cent., and it is not improbable that it will amount to slightly more than this. In figuring the repair costs to be charged against each day of use or acre plowed, the average annual charge has been taken as 4 per cent. of the first cost.

Plowing Done Per Day.

The number of acres covered per day by a plow drawn by a tractor is usually slightly greater than that covered by the same sized horse-drawn plow. The acreage covered by two different machines, each pulling the same number of plow bottoms, often varies considerably, because they travel at different speeds, are in different kinds of soil and plowing different lengths of furrows. Theoretically a 14-inch plow when drawn by a tractor should cover about 3 acres in an ordinary working day of 10 hours, as the average plowing speed is slightly more than 2 miles per hour. This will hold true in actual practice when the plowing conditions are favorable, provided the outfit does not give trouble. That is, a two-plow machine should plow 6 acres and a ten-plow outfit 30 acres per day, provided both travel at the average rate of speed and are kept moving. However, where trash is to be turned under which frequently clogs the plows, each plow drawn by a large tractor will cover much less ground in a day than one drawn by a small outfit, since the delays will naturally be in proportion to the number of plows pulled. A delay on account of one plow on a two-plow outfit stops only one other plow, while on a ten-plow rig, for example, it stops nine other plows.

In view of these facts it is apparent that when plowing under unfavorable conditions large gang plows do not cover as much ground per day per plow as the smaller ones. However, one man accomplishes considerably more work with the large outfits, even under such conditions.

According to the figures furnished by tractor owners in Illinois the area covered per day (10 net working hours) in plowing with the tractors most commonly used is 6½, 8¾ and 10 acres for the two, three and four-plow outfits, respectively. These figures for the two-plow and four-plow outfits correspond closely with the averages shown in Farmers' Bulletin 719 for the same sizes of tractor, while the average acreage covered by the three-plow rigs shows an increase of one-half acre per day. This is doubtless due to the placing on the market of a large number of three-plow outfits of slightly greater power, and therefore larger capacity per day, than the three-plow machines in use when the data for Farmers' Bulletin 719 were obtained.

Many tractor owners require their outfits to pull one more plow than they are rated to handle. Under such a load the outfit does not cover as much ground as would be covered by a machine built to pull that number of plows. Three plows behind a two-plow tractor will cover only a little more ground, as a rule, than will the two-plows, because the tractor usually will travel a little more slowly, partly because the engine is overloaded and does not maintain its proper speed, and partly because the drive-wheels will slip more than usual with a load heavier than the machine was designed to pull. As a consequence delays on account of small holes or slight grades will be more common, as will also mechanical difficulties.

The reports of a number of men who were thus overloading their machines were tabulated and compared with the results obtained by other men who owned the

Digitized by Google

same make and size of tractor, but who were requiring their machines to pull only their normal loads. This comparison showed that the repairs on the overloaded tractors were considerably higher, more time was lost per day with these outfits, and the estimated life of the overloaded tractors was considerably less than for the machines pulling normal loads. At the same time the increase in ground plowed amounted to only about 1¼ acres per day; that is, the additional plow covered about one-half as much ground in a day as did each of the two plows which constituted a normal load. The gasoline consumption per acre averaged somewhat lower for the overloaded machines, as would naturally be expected, since the tractor would not have to travel so far to plow an acre. However, the depth plowed was not so great, and it is reasonable to suppose that the plowing conditions were generally favorable or the third plow would not have been tried. The increased acreage per day and the slight saving in fuel together would not offset the increased repairs and the value of the time wasted from trouble with the outfit. Overloading a tractor is inexcusable save in exceptional cases where speed in completing a job is of the utmost importance. If such speed is required regularly the work could be done more cheaply and satisfactorily with a larger outfit.

The acreage covered per day at field operations other than plowing will vary, of course, with the width of the implement pulled, and this in turn will depend upon the relative draft. It is therefore impossible to give for such operations average figures which would be of value. In harrowing or disking, for example, the width of the implement pulled will depend upon the adjustment of the disks or harrow teeth and the depth of the ground being worked. The nature of the soil will also have an influence. The speed of the tractor ordinarily will not be quite as great in soft ground as where the machine has a firm footing, because of the greater slippage of the wheels. On the whole, not so much time is lost on account of clogging or other obstructions when harrowing and disking as when plowing.

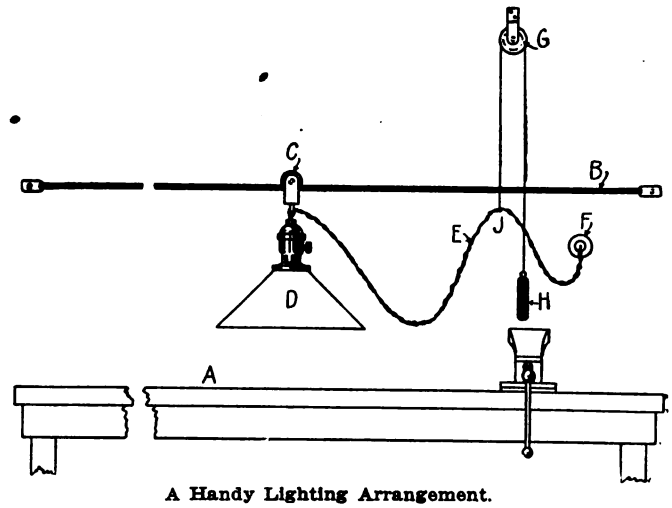
(To be continued.)

A HANDY GARAGE LIGHT.

The Workbench and Vise Should Be Well Lighted or the Mechanic Cannot De Good Work.



A FEW days ago as I was passing through a repair shop, I was attracted by the peculiar antics of one of the workmen. He was dancing up and down and occasionally he would wave one hand in the air; he wasn't doing this quietly by any means, but was filling the air with a sulphurous string of words that hardly look well in print.

So interested was I that I stopped to watch. After quieting down, Kelly, for that was his name, snatched rapidly at something on the workbench, and again went through the same performance. There was nothing offensive looking on the bench, and I certainly was curious as to the reason.

Kelly went through the same trials for a third time, then crawled beneath the workbench and in a minute backed out again; then he went to work as though nothing had happened.

What happened to Kelly? was the question that kept running through my mind, and finally I returned to him and put the question to him directly. He acted rather "sheepish" for a minute or so, then solved the problem. "Nothing but a bare light wire," he said. "The thing fell across one of those wrenches, just the one I wanted, and I didn't want to crawl down beneath the bench to turn off the current."

There you have the reason for many minutes of lost time, doubtless the same trouble exists in many repair shops. The flexible lamp cord gets into the oil and grease and sooner or later the insulation is worn off. If a fuse doesn't burn out, the wire will give every workman "nerves" if he don't watch out.

A Handy Lighting Arrangement.

Keep the wire out of grease and away from the bench in the manner illustrated. On the wall back of the bench screw a long, round bar, B, and upon it mount a pulley block, C, which is soldered to a light socket and shade, D. Cut the flexible cord just long enough so that the light can be carried to the end of the bar B, attach it to its plug in the wall, F, and overhead place a second pulley block, G.

About midway between the light and the socket, on the cord, tie a length of string, carry it over the pulley G and hang a weight to it as at H.

You see that the device answers two purposes. It preserves the light wire and it sheds light to any part of the workbench, just where the mechanic needs it.

TERMS OF SUBSCRIPTION.

One Copy, One Year, Including Postage $1.00
One Copy, Six Months ..... 60 cents
Single Number ..... 10 cents
Except in zones 7 and 8, comprising the following States: Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington, Wyoming. In all these the rate is $2.00 per year, made necessary by the unjust increase on the part of Congress in second class Postage.
Foreign Subscriptions ..... $1.50, or 6s. 3d.

Remittances should be made by Express Money Order, Draft, Post Office Order or Registered Letter. Foreign remittances, where possible, by International Money Order.

ADVERTISING RATES SUPPLIED ON APPLICATION.

The Automobile Dealer and Repairer in New Zealand.

Mr. R. Hill, Matlock House, Devonport, Auckland, New Zealand, is our accredited representative in New Zealand for obtaining new subscriptions.

MISSING NUMBERS—Our readers are requested to remember that we are always pleased to re-send numbers which have gone astray in the mails.

A Happy, Prosperous and Glorious New Year to All Our Friends.

THE holiday season of peace and cheer has once more arrived, and we take this opportunity of extending our best wishes for a prosperous and glorious future to all of our readers. It is the time for new resolutions, and a time for cordiality and friendship.

We doubt if there is any other paper which has as many friends as our magazine. True, there are many that have a larger list of subscribers, but in our case, we feel that all of you who read are a part of our big family. Like you, we have gone through months of trouble, and like you, we rejoice in the peace that is before us; peace which is mingled with prosperity, and we heartily assure you that our prosperity will mean a bigger, and more valuable magazine for you.

We have great plans for the coming year. We expect to publish a magazine that will be second to none, in our field; a magazine so valuable to our readers that during the year 1919, death will be the only excuse for the cancellation of a subscription. When we read over the magazines which we have issued during the present year, we are possessed with a feeling of pride, which is reflected by the letters we receive from the subscribers.

We feel safe in saying that we have furnished 100 per cent practical articles for our readers. We feel amply repaid for the time we have spent in selecting articles, but we also feel that there is a great chance for improvement.

Conditions for the past year have been adverse; we have been limited as to the paper, as to the number of pages, and tied down by the high postage rates. We are optimistic as to the future, however, and can safely promise that our subscribers will receive one hundred times the value of their subscription price during the coming year.

Our Flag Has Its Place in Everyone's Heart, Let Us Keep It There.

HIGH above our heads floats the symbol of Liberty, the American flag. Throughout the world our flag stands for Victory and Democracy. We must not feel that we won the war. America only helped to win. What the outcome might have been had America withstood the insults of the hun, can never be known.

Suffice it that it was through the efforts of our brave boys that the war was ended. The attention of the other nations of the earth, in addition to those with whom we were allied, has been called to us. Our flag to them is the symbol for Liberty and Justice. Even our enemies have turned toward us for salvation, and so for the first time in the history of the world, one flag has a singular place in the home of every person on the earth. The flag which stands for America can well be termed as America's trademark. Let us not permit the other nations on the earth to forget America.

In South America we have a land of golden opportunities, a country that is craving for many products, and we can satisfy that craving. In Canada we also have many wonderful opportunities. Undoubtedly we shall be called upon to furnish Europe with many products as well. If we care to compete with foreign products, and undoubtedly there will be great competition, we must study our market well, and be sure to furnish goods that are acceptable to our purchasers.

Every mistake that we make means lost prestige, and if our manufacturers make very many mistakes, we lose the trade altogether to some foreign country more enterprising than ourselves.

Good Times Ahead.

According to Judge Gary, Chairman of the United States Steel Corporation, the outlook for business, now that the war is over, is very reassuring. Judge Gary is a clear-headed business man and has exceptional opportunities for sizing up the situation as to business throughout the country. Among other things, he recently said:

"The United States is the richest of all countries. It possesses one-third or more of the total wealth of the world. It has become the leader of finance, and in this respect may properly exercise a commanding influence. Its natural resources are immense and are susceptible

Digitized by Google

of increasing development. If industry is protected and fostered in accordance with its merit the war burdens surely, even though gradually, will be lifted. We shall be a creditor nation with a large interest income, more virile, more progressive, more successful, wiser, and better, than ever before."

Everybody knows, of course, that this country has not been making large quantities of goods for general consumption, but that its manufacturers have very largely been engaged in making war materials of various kinds. Now that there is no occasion for the manufacture of munitions or war materials, manufacturers can go back to the making of regular goods. Business of all kinds has been hampered for the past year by a lack of raw materials of all kinds.

Of course, there is likely to be a considerable readjustment in the matter of wages, before things settle down. Men who have been getting $10, $15 and $20 a day or more in munition plants, naturally must not expect any such wages from legitimate business. They will have to get back to old conditions again.

It is well known that nearly all building operations have been suspended, for one reason, because builders could not get the necessary steel so far as buildings in large cities are concerned and in the country districts building material has gone up to prohibitive prices, and furthermore, there was a scarcity of labor at prices which builders could afford to pay.

Business in this line is likely to be resumed very slowly because dealers in material will keep prices up as long as they can and the workmen will keep wages up as long as they can, probably. It is quite plain that building operations of all kinds must be restricted until there is a considerable drop in the cost of materials and wages.

Tremendous Traffic Increases Call for Greater Transportation Facilities.

WITH the ending of the war comes a problem of great importance, the need for better transportation facilities. It is true that our railways and waterways will be opened for commerce and be able to take care of raw and finished products to a greater extent than during the war. There are many people who consider that the increased facilities will take care of all of the products which are turned out by our manufacturing plants.

We realize, however, that America is able to put out nearly 100 per cent more products than she was in 1914. Even at that time our railroads were congested. Therefore it stands to reason that with this tremendous increase our railroads will be swamped.

The answer to our problem is had in two words, MOTOR TRUCKS. Those of us who live in the cities have begun to realize that a large portion of inter-city and even inter-state traffic can be taken care of by trucks at a lower cost than by freight. The necessity for handling is reduced to a minimum. Short hauls can be made at a tremendous saving, and much time can be saved as well.

There is an enormous demand for motor trucks. Every merchant, manufacturer and farmer is investigating the possibilities to be had in these machines. The dealer in trucks is sure to reap a golden harvest in the next two years. Therefore, get into the game.

According to the Law of Supply and Demand, Prices Must Drop Very Shortly.

THE theory that present steel prices, or prices approaching those now prevailing, will be maintained because of the call upon America for steel with which to rebuild Europe, is grossly absurd."

This timely comment upon the present steel situation by the N. Y. Sun contains the matter in a nutshell. We can do no better than to quote various portions of this same editorial which was written by one who evidently knows conditions. The "Sun" goes on to say that "it would not be unwarranted exaggeration to say that during the entire war there has not been as much steel destroyed in wrecked buildings as is contained in the Woolworth Building alone. The reason for this is that the buildings of devastated France were practically all constructed of brick and stone. What is true of France, in this respect, is true of Belgium, where the destruction was relatively small as compared with France.

"Neither France or Belgium will break their necks to build destroyed towns in a minute. They will take their time about it. It is their way of doing things. We may as well, therefore, dismiss at once the matter of rebuilding Europe as a price sustainer for American steel and iron. Confined largely to domestic demand when the Government ceases to be a large customer (and this will soon happen) steel mills will find a restricted call for their products at war prices or anything approaching them. It is a question of reasonable prices for steel, and that quickly, or idle steel mills. There is no other solution of the problem and idle steel mills mean low prices for steel and even frequently starvation prices."

The Labor Problem and the Effect of Immigration Upon Our Wage Scale.

ONE of the greatest questions at the present time which affects every individual in the country, is the labor problem. Laboring men call upon capital to pay war wages. Labor calls upon capital to reduce the price of finished products. Labor calls for shorter hours, necessitating less production. At this time we do not want to enter into the discussion of this problem. Time only can help to solve it.

There is one vital fact, however, which concerns this problem, and which merits discussion, and that is immigration. Given the oportunity, our former enemies will

Digitized by Google

flock to this country. Our own working men will be forced to compete with them in the fight for positions.

Accustomed as they are to low wages, a normal wage in America will mean a golden opportunity to the foreigner. We must all do our part to discourage this sort of immigration. If we want to keep our positions and obtain the wages which are being obtained to-day, immigration of aliens must be stopped. We are willing to receive with open arms those who have stood with us in the war, but we must frighten away those who have stood against us.

It is the one question that labor and capital can agree upon without any difficulty and it is the most important phase of the whole situation. Because a man has a german or austrian name, however, we must not bar him from our factories. His character must be investigated, and his status determined. If he is an American citizen, he deserves all of the consideration that we give to our own citizens. In America we have a large population of foreign-born germans and austrians who are as loyal to America as the Americans themselves.

We cannot, nor do we want to discriminate against those Americans no matter where they were born, but we must protect their interests as well as our own. We must use all of our influence to prevent a flood of enemies from entering our country and swamping us.

Wonderful Possibilities in the Use of Trailer Cars and Removable Bodies.

A FIELD of the industry which has heretofore been greatly neglected is the sale of trailer cars. Every manufacturer should investigate the possibilities held forth by this unit. One truck or tractor can be used to haul one or more of these trailer cars.

Consider, for instance, the case of one who makes facing brick or tiling. The time taken in loading these bricks upon the wagon is considerable. Each brick must be handled by itself, and unloaded in the same way. With a trailer, it is unnecessary to hold the truck while this work is being done. Trailer car bodies are furnished in many styles and loaded while the truck is transporting a filled body from the point of delivery. At the point of delivery the body is removed, and an empty one put in its place. The empty one is taken back to the factory, while a filled one is substituted.

The truck itself is used simply for haulage purposes, and the time incident to the changing of the bodies is small as compared with the time that would be taken to load the carts. In the case of short hauls such a removable trailer or truck body is a paying proposition. Every manufacturer should investigate the possibilities of units of this sort.

The Dark Cloud, When Turned Inside Out, Proves To Have a Silver Lining.

IT has been said that there is a corresponding benefit derived from every accident, and it is probably this thought that gave rise to the old saying "Every cloud has its silver lining." Unquestionably, the world war has had a remarkable effect upon the automobile field. Up to the year 1916, there was a certain class of car owners who felt that a new automobile every year was a necessity. They felt that the time saved by owning a new machine more than paid the additional cost.

In the face of the decreased production of automobiles, conditions naturally changed. Few men could afford, or in fact were allowed, to purchase new cars, if their old machines were in condition. As a matter of fact, the patriotic car owner did all he could to save his machine, and keep it in condition.

He found that his old car was not a wreck at the end of its second season. Perhaps he is still using this same machine, and knows that it is still as valuable to him as it was when he purchased it. We have learned how to conserve our resources, and therefore how to save perfectly good machinery. It is no longer fashionable to be a waster.

An automobile one or more seasons old has just as much service value if it has been used properly, as a new machine. It still devolves upon us to conserve resources in order that we may not pass along the tremendous war debt to our children.

It is your duty, as a patriotic American, to keep your car in repair, to read, to learn, and to heed the advice of your repairman. We should all do our part toward the building up of American commerce, and bearing in mind the fact that we cannot eat our cake and sell it too, we should save our products in order that we may enrich ourselves as well as further our interests by exporting them to other countries.

What Can Be Done to Utilize Those Factories, Built During the War?

ONE of the biggest problems which confronts the country to-day is the utilization of those factories which heretofore have been engaged exclusively upon ammunition or kindred work. Since the outbreak of the world war, four years ago, the capital investment in manufacturing plants has been nearly doubled. In many cases, whole towns, and even cities, have sprung up over night.

Now that the war is over, however, the need for these great organizations has passed. Shall we, however, let the enormous factories lie idle? Every day of idleness means a direct loss to this country. National wealth depends upon the output of products, and the conservation of national resources. The loss of one of these plants means a direct loss to the community. The burden of taxation falls upon the remaining plants.

Our salvation, therefore, depends upon the utilization of the factories for the production of such commodities as we may be able to use, or export. The automobile industry is capable of absorbing practically all of such plants. However, when we speak of the automobile industry we include machinery manufacturers who dispose of their products to this branch of trade.

Digitized by Google

It is to our advantage that we boost America. We must spread the propaganda that American made machinery and American made products are the best in the world. We must stand first in the production of machinery, tools and automobiles. We cannot afford to drop into second place, but must advertise our goods in every corner of the world. Let our slogan be "America first."

AN INTERESTING ITEM.

The annual report of the State Industrial Accident Board of Massachusetts, recenty issued, discloses the curious fact that there have been more fatal accidents in that State for the past year from vehicles drawn by horses than from automobiles. It appears that there were 23 fatal accidents in connection with horse-drawn vehicles, and only 20 by self-propelled vehicles.

Brazing and Soft Soldering

An Article Dealing With a Branch of Repair Work That Is of Interest to Every Reader.

BY JAMES STEELMAN

THE repair of automobile parts calls for the exercise of much skill and judgment. The service the parts have to perform is frequently very severe, so that the repair must often retain a large percentage of the full strength of a new part. The variety of materials used in an automobile also complicates repairs for the double reason that this fact greatly broadens the amount of knowledge that the repair man must have and the the use of diverse metals in co-acting parts often introduces new problems.

Among the metals, with which it is necessary to deal, are cast iron, steel, aluminum, aluminum alloys and copper-zinc alloys. These are perhaps the most important. And the re-union of breaks in parts made of these materials constitutes an important portion of what the automobile repairer has to do.

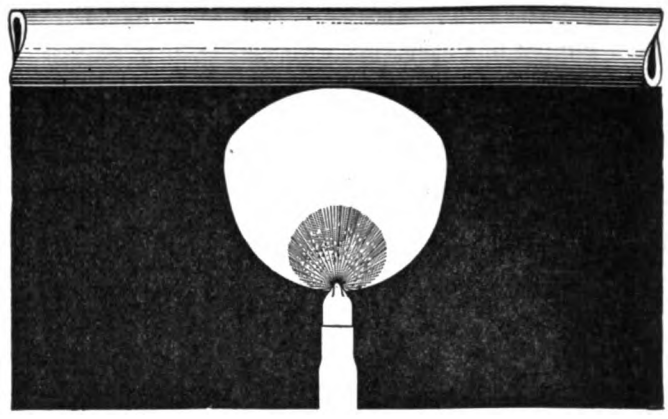
Three Repair Methods.

There are several methods of effecting such re-unions. These differ in respect to their suitability to the varying job. In fact, if an automobile repair man wants to be really up-to-date, it is necessary for him to understand all the principal varieties of methods of joining metals, so that he may be able to judge which will best suit the job in hand and so that he may have the knowledge of how to apply the method after it has been selected.

The principal methods of uniting metals, so far as automobile repair men are concerned, are three:

(1) Ordinary blacksmith welding;

(2) Gas welding, usually with torches consuming oxygen and acetylene or oxygen and hydrogen;



(3) Soldering and brazing.

All have their place. Probably No. 1 is the best of the lot wherever it is possible to apply it in the most approved way. It is limited, however, to one or two materials. The other methods are applicable to a great variety of metals and may be used to join diverse materials.

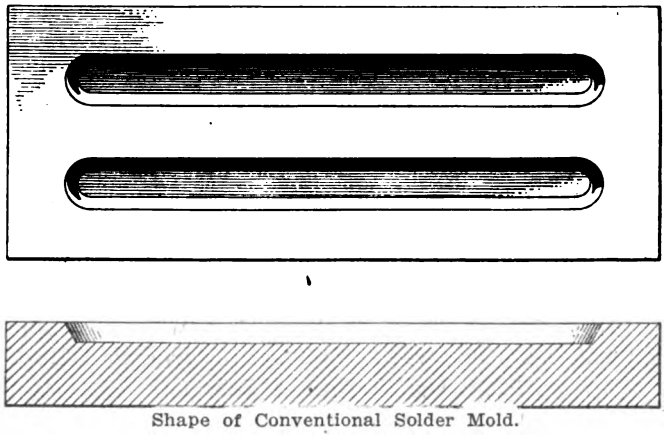
An important difference, especially for automobiles, between methods Nos. 2 and 3 consists in this: With gas welding, it is usually possible to select for the joining material precisely the same material that is in the work itself; with brazing and soldering, on the other hand, the joint is usually quite different from the work. In the case of many parts about an automobile, this difference between the two methods will play little or no part. In the case of others, however, it may matter a good deal. Where the joint will be exposed in service to the wet, especially in conjunction with anything of an acid character, we are to expect electrolytic action.

Electrical Action in Joints.

This may or may not be important. That is one of the things to judge at the time. Where electrolytic action is to be feared, there brazing or soldering are

Small Work Can Be Preheated Over a Gas Jet.

scarcely applicable, unless the work and the joint are to be practically of the same material. For example, there may be a break at a point where there is continued exposure to the weather. If the joint is made by brazing or soldering with a diverse metal, then everything is ready for electrolytic action to start upon as soon as the presence of moisture, especially moisture more or less acidulated, is realized.



Ordinary dampness mixed with the carbon dioxide in the air may be responsible for a good deal of the electrolytic action that takes place. The result is apt to be a

Digitized by Google

breaking down of one of the two metals. The gas welder avoids, or may avoid, this danger by using the same material in the joint as occurs in the work. Sometimes this is reasonably possible with brazing or soldering.

Another difference between methods No. 2 and 3 consists in the fact that No. 2 is probably easier to apply to a part still in place. This I would explain as due to the fact that, with the gas methods, we have often no need to heat the whole job at once. We do the work a little at a time. There are occasions, however, where even with gas welding we need to pre-heat and this may mean practically that we heat the whole job, though not with the torch.

There is one big rule about brazing and some soldering. It is this: The work must be hotter than the braz-

Shape of Conventional Solder Mold.

ing or soldering material, when that material is at its melting point. This means, for one thing, the melting point of the work must be higher than the melting point of the joining material.

Generally speaking, the higher the melting point of a joining material, the stronger it is. This fact tends to create the desire to use joining material that melts at as high a point as the circumstances permit.

Because it is so often better to have a very high melting point for the joining material and because this point must nevertheless be lower, distinctly lower, than the melting point of the work, it is necessary to have a great many varieties of joining materials.

Brass is the chief material used for joining. Innumerable varieties may be made by changing the proportions of copper and zinc. We may vary from all copper and no zinc to all zinc and no copper. These variations give varying melting points. The more zinc, the lower the point. I give herewith a table showing the temperatures for a range of alloys. The curve exhibits these facts and shows also what are presumably the temperatures corresponding to intermediate alloys.

PERCENTAGES IN THE SOLDER

Copper	100	90	80	70	60	50	40	30	20	10	0
Zinc	0	10	20	30	40	50	60	70	80	90	100
Melting Point, F	1983	1904	1823	1706	1652	1616	1508	1436	1292	1076	786

It will be noted that we may get any temperature between 786 and 1983 degrees Fahrenheit. The figures in the table are derived from tables published by the Smithsonian Institute at Washington, D. C. They are to be regarded as having been obtained from samples dealing with metals of a very high grade. The melting points corresponding to low grades of copper and zinc will undoubtedly be lower than with high grades of these materials. This must be borne in mind.

I now give two other tables which enable those interested in soldering to get temperatures that are low.

LEAD-TIN ALLOYS

PERCENTAGES IN THE SOLDER

Lead	100	90	80	70	60	50	40	30	20	10	0
Tin	0	10	20	30	40	50	60	70	80	90	100
Melting Point, F	619	563	529	504	464	428	374	365	392	421	450

LEAD-TIN-BISMUTH ALLOYS

PERCENTAGES IN THE SOLDER

Lead	32.0	25.8	25.0	43.0	33.3	10.7	50.0	35.8	20.0	70.9
Tin	15.5	19.8	15.0	14.0	33.3	23.1	33.0	52.1	60.0	9.1
Bismuth	52.5	54.4	60.0	43.0	33.3	66.2	17.0	12.1	20.0	20.0
Melting Point, F	205	214	257	262	293	298	322	358	360	453

It will be noted, from a comparison of all three tables, that it is possible to get solders corresponding to pretty much all temperatures from 1983 degrees Fahrenheit down to 205 degrees. There is a big gap between 786 and 619 degrees at the transition from brasses (copper-zinc alloys) to lead-tin alloys and small gaps in the lead-tin-bismuth table. For intermediate temperatures of the brasses and lead-tin alloys, the curves supply the data as to the proper mixtures. It is advisable to remember, however, that *ordinary commercial* metals will probably melt some degrees lower. The tabular melting points are accordingly to be regarded as too high.

To test whether a high temperature joining material has a low enough melting point, a convenient method is as follows: Heat the work, or a sample of the same material as hot as it is proposed to heat the work when actual brazing is going on. Put some small bits or grains of the joining material on the hot surface and note whether these bits melt. If they do not melt rather quickly, the joining material is to be regarded as having too high a melting point.

Aluminum is to be soldered by a special solder. There are many of these. I pass along the following 26 recipes which are understood to have been first published collectively by *Machinery*.

SOLDERS FOR ALUMINUM

PART GIVEN IN PERCENTAGES

*10% phosphorus.
‡Vanadium 0.25% is to be included.
‡Chromium 5.00% is to be included.

It will be noted upon going over the table that all contain either tin or aluminum and that quite a number

Digitized by Google

contain both. It is understood that all 26 of the foregoing aluminum solders have been successfully used.

It will be well now to add the melting points of a number of metals, for we need to know the melting point of the work as well as that of the joining material.

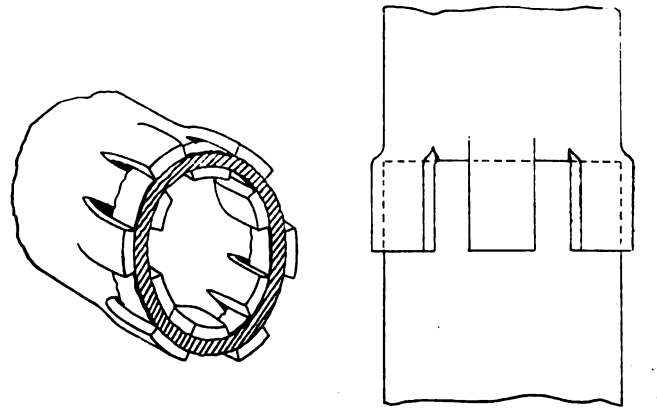
Melting Points of Various Metals.

	Degrees F.
Platinum	3230
Wrought iron	3000
Steel	2400 (about)
Cast iron	2000 (about)
Copper	1983
Bronze	1690 (about)
Aluminum	1160
Zinc	786
Lead	620
Tin	445

Soldering and Brazing Operations.

The essential things are but few, although it may sometimes require a lot of trouble to produce some of them. Suppose we have a copper tube to braze onto another one. One of the essentials is that the metal surfaces be clean. But what is clean? What is really required is that nothing but copper shall be at the surface. Often what is there is an oxide of copper.

Clean a piece of copper with an acid, rinse it off with clean water and wipe dry. The metal will be bright. It is clean. Now put the piece over a gas flame and you will soon see the color change to a dull hue. Copper oxide is forming and the cleanness is gone, in so far as brazing is concerned.



The general procedure of brazing begins with cleaning the surfaces by means of an acid or equivalent. The next step is to apply the hard solder or brass together with the flux. The third and final step is the heating operation. Among the preliminary steps is the placing

Beveling the Tube, Inside and Out, Before Making the Joint.

of the parts. They may be set edge to edge. The process of uniting them may then be called *butt brazing*. If, however, the one part is arranged to overlap the other, we have *lap brazing*. There are in addition, a number of variations in methods. In some work, the article is dipped into the melted brass or solder but this procedure is scarcely suited to repair work for the reason that the variety is too great.

A *muffle* is sometimes used to inclose the work while it is being heated. The muffle performs the useful service of controlling the heat. With it, it is possible to heat pretty evenly and to halt the heating when it is

How Two Thin Tubes Can Be Joined Before Brazing or Soldering.

desired to do so. This is desirable when the work and the solder melt at points not far apart.

Brazing Copper Tubes.

If the copper tubes which are to be united have heavy walls, we may prepare the edges by giving each a long bevel. This beveling is done in such a way that one end may be telescoped into the other. If the material in the pipe is thin, the procedure is different. One method proceeds by cutting slits in one edge. These slits are somewhat out of parallel with the tube axis. When the edge has been slit all around at short intervals, the next step is to bend the tongues of metal between slits alternately in and out. In this way, there is produced a kind of circular groove all around the pipe end. The other end is thinned and then set in the groove. The tongues may then be forced to hug the unslitted end by inserting a wooden core and using a wooden mallet. The work may now be set up in a vertical position.

The cleaning of the surfaces will naturally be done before putting them together. A strong salt-and-water brine will often be sufficiently active to accomplish what is wanted. The copper is then annealed. This is done by heating the copper tube to a cherry red heat and then immersing it in clean and cold water. This is a peculiar result,—steel, it will be remembered, when highly heated and then quenched will become hard and tends to brittleness.

After annealing, the surfaces may be cleaned again. Acid will not necessarily be needed this time. It depends upon what has been done with the work since the acid treatment. Clean water and sand will usually or often be sufficient. A bit of clean cotton waste may be used as a means with which to apply them.

There are different ways of managing the flux and the spelter. In the present case, it is permissible to

Digitized by Google

pulverize both and make a half-and-half mixture. By mingling a small amount of clean water with the mixture, it is possible to convert it into a kind of paste, thus making it convenient to use.

Borax is a suitable fluxing material for the job in question. The paste is put round the joint in such position that when heated gravitation will cause the flux and the spelter to flow into the crevices of the joint. A charcoal or other fire is now employed to do the heating. After a time, the borax will melt and form drops. Next, blue fumes will rise from the spelter showing that the spelter is about to melt.

If the spelter does not start of itself to flow into the crevices as the heating goes on, it may be necessary to jar the work slightly with a mallet or hammer. Care should be exercised in placing the mixture of spelter and borax so as not to have more at one point than another. When the borax has melted, if the spelter will not flow at the proper moment, a little more borax, in powder form, may be added as an additional help to the jarring already suggested.

Another method is to bell the one end of copper tubing so that a circular groove will be formed when the plain end is set in place inside. If the belling is suitably done, the operator may now put his powdered flux into the groove, filling up the bottom all round. The granulated or pulverized spelter may then be filled in to the top of the groove. Or, a mixture of spelter and flux may be filled into the space.

Dip Brazing.

The *dipping* method already mentioned may at times be used where there is a good deal of small work. A suitable pot containing the spelter is heated by a proper fire. The fire may be underneath and rise on the sides all round. A quantity of the flux is put in. The difference in specific gravity will cause the flux to form a molten layer on top of the melted spelter. Suppose the work to consist of a lot of rings. As the ring or a large part of it is to be immersed, it will be convenient to protect the parts of the work not concerned in the brazing. This may be done by using a special *anti-flux graphite.*

When all is ready, the ring held by a suitable appliance is dropped down into the flux in such a way as to provide for covering the surfaces that are to be brazed together. After a little, the region of the joint will have heated up and the flux will have cleared off the surfaces. The article is now immersed more deeply in order to get the joint into the melted spelter. Here the brazing takes place automatically.

The necessary depth of the layer of flux will naturally vary with the work and the size and character of the joint. In this procedure there is absolutely no interference from the atmosphere after the flux has done its work.

THE NEW YORK AUTOMOBILE SHOW.

THOSE of us who have been bewailing the fact that industry could not return to normal within another six or eight months, are interested in the fact that the New York show will be held this season. Despite the fact that the exhibition will be staged early in 1919, the event is suggestive in that it shows the return of the industry to normal conditions.

The week beginning February first, and ending February eighth, will be devoted to the exhibition of passenger cars and accessories. The show will be held at Madison Square Garden, and undoubtedly will be more largely attended than ever before, for the reason that every interested buyer will surely be there.

Following directly upon this, and continuing until the following Saturday night, will be held an exhibition of trucks. This second show is to be held at the same place, and is made necessary because there is no place in New York where a combined show, embracing both lines of the trade, can be held. Our next number issued in January will contain all the details relative to these shows.

A NEW GASOLINE SUBSTITUTE.

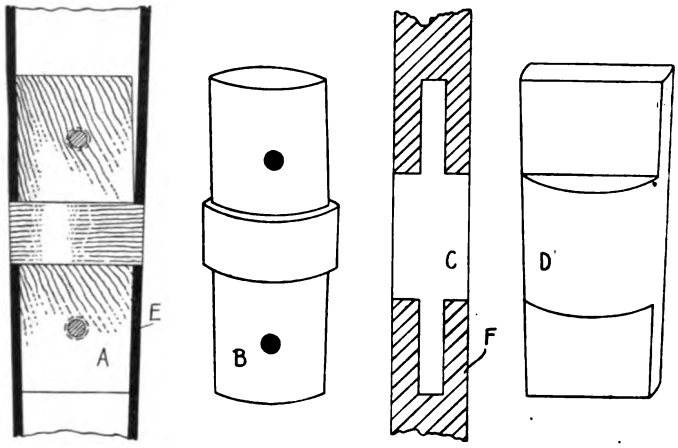
After many months of experiments and satisfactory tests conducted by Major O. B. Zimmerman and Capt. E. C. Weisgerber of the Research and Development Division of the General Engineering Depot at Washington, a new fuel of which kerosene is the base, has been announced. It is claimed that this mixture, which is termed "liberty fuel," is odorless, tasteless, and non-corrosive. It leaves less residue of carbon than gasoline, requires less oxygen for combustion and is said to develop greater horespower.

As a matter of fact it is claimed that the force of the explosion has been found to be 30 per cent greater than that of gasoline. The people who have been interested in this product claim that the substitute can be made at a lower cost than gasoline can be purchased. The process of manufacture is simple and the ingredients cost but little. It is hoped that the public will soon benefit by this discovery.

MENDING TOP BOWS.

Top Bows Can Be Mended by Binding Splints Across Them, But the Job Has an Unsightly Appearance.

ONE thing that the war has done for me is to teach me how to conserve, not because I wanted to learn, but because I couldn't afford to be quite as extravagant as formerly. A short time ago I tried to run my car beneath a shed that was just half an inch too small for the machine—that is, the roof of the place was just on a level with the top. Consequently, as the shed was strongly constructed, my top yielded up the ghost and telescoped into itself before I knew what had happened.



Before the war I would have thrown the top in back of my neighbor's garage (all his empty cans are behind

Digitized by Google

my garage), then gone to the topmaker's and in one compound word said "giveusanother."

As it was, however, I tried to manicure and massage the bent tubes into shape. I didn't succeed, so I took the wreck to a topmaker and suggested that he do his derndest—he did.

I hung around for a while and watched him work, thought it would make a good story for the ADR.

Repairing Bows and Bow Irons.

In the first place he removed the covering material from the bent portions and broken bows, so that he would have room to work. Then just above each dent or bend he cut the tubing across with a hacksaw.

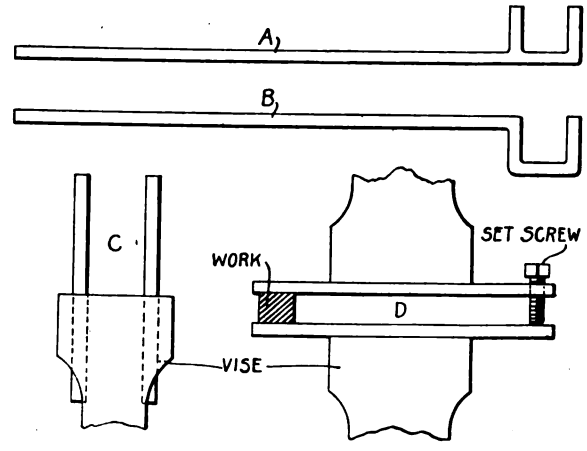
He carefully trimmed down a piece of pine wood into shape that approximated the inside of the tube and drove it into the tube. After a little coaxing the tube was straightened out, except for the extreme ends, where it had cracked. He cut off this cracked place and then turned out a piece of oak into the shape shown at B in the accompanying sketch.

After he had fitted this plug to the tube he drove it in and then drove the other part of the tube over it, as shown at A. I noticed that he used plenty of orange shellac, and finally he pinned the plug into place by two rivets, one in each part of the tube.

A few of the wood bows were so badly splintered that they were discarded, but two of them at least were repaired by doweling, as shown in Figure C. The dowel pin was shaped by hand, as shown at D, and glued into place. After the joints had been given a couple of coats of paint, one would hardly know where the repair had been made.

BENDING WRENCHES.

By CHAS. E. DURYEA.



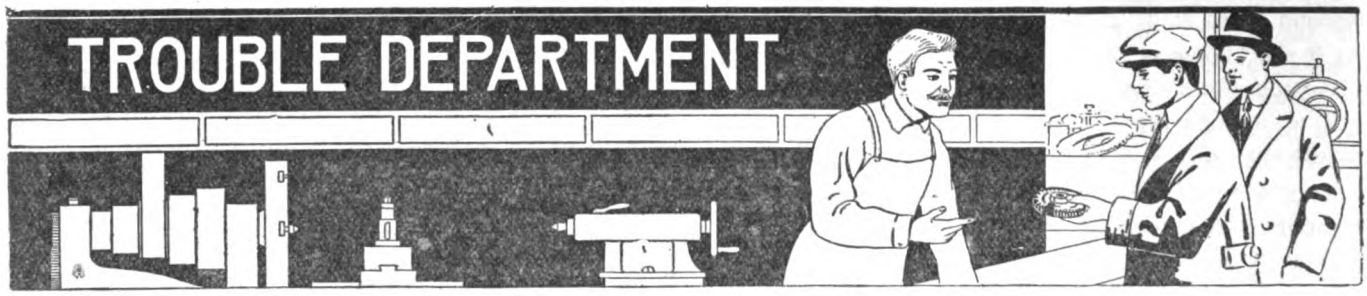
The carriage trade was the logical medium to handle automobiles, but too often those most in line failed to see the opportunity, and so in this case both industries lost much of value. Every carriage shop has bending wrenches for the many jobs that need them, but the auto, being factory made, has less need and the repair man almost no knowledge of them.

A bending wrench differs from the usual kind, in that its jaws have no corners. They are usually simply two round fingers welded to the end of a bar. Sometimes the bar itself is bent to form the fingers, as at B in Figure I, but this shape, although easier to make, is not so handy to use. The sketches make these two shapes clear. In forming the ornamental iron work often found on carriages, something to bend without marring the metal was needed.

Often there is need for such a device in the auto repair shop, and a very fair substitute can be made by gripping two round bars in a vise, as at C. These of course are not so firm and dependable as if they were part of a real wrench, and they have the disadvantage that the work must be brought to them, but they help out perfectly in most cases.

They can be kept from spreading by dropping a ring over their tops after the work is in place. If they seem too light and tend to bend, a monkeywrench can be used to apply a counter strain to their tops. They have the advantage that they can be spaced as desired. For bending wire or forming spring eyes a pair of small rods in the vise are often better than round-nosed pliers.

A modification of the idea, as at D, gives a good vise extension. Frequently a job is found that cannot well be placed in the vise. In this case two rectangular bars can be projected far enough above or to one side of the vise to catch the work properly and project beyond the vise jaws in the opposite direction. A block between the opposite ends fills a space as thick as the work, and



Illustrating Bending Irons and Methods for Bending.

when the vise is tightened both the work and the filler block are gripped.

If there is much work of a kind requiring such an extension the bars and block had better be held together by boring through them and inserting a bolt. If there is variety to the work a long set-screw tapped into the end of one bar makes an adjustable device so it is easy to get the bars parallel and thus best grip the work.

Digitized by Google

We cheerfully answer the questions in our trouble department, but in many cases we are unable to diagnose the trouble properly because we do not have full details. Frequently we receive letters asking for information but giving no data upon which to work. We don't like to give opinions upon insufficient data; we cannot help you unless you tell us everything you can about your machine: the name, year and model, the kind of equipment, and the type of equipment where possible.

Be sure to sign your name and give your full address. Daily we receive letters which are returned because the name or address is not correct. Our department will not permit us to answer all in the magazine, and we like to answer a large part of the questions by mail; therefore be sure to give full address.

Knock in Maxwell Car.

2556

From N. S. Nicolaisen, California.—I own a Maxwell, 1916 model, and have had it thoroughly overhauled. It ran all right for a time, but now there is a knock in the engine. The repair man says the knock is in the timing gear and that there is nothing I can do for it. If you can help me I wish you would.

Can you tell me where I can obtain an instruction book that fully covers the Maxwell engine, the wiring, etc.?

Reply.—You have not given us details enough upon which to base a good opinion, and so we will have to generalize more or less.

If the knock is in the timing gear, there is little danger of damaging the engine by letting it go. The only things you will spoil are the timing gears themselves. If the knock gets worse, however, you had better replace both timing gears. Do not replace one without replacing the other.

It is very possible that if the trouble is in the gears, the knock is caused by a loose key. Remove the gears after having marked them, so that you can re-time the engine correctly and see that the key is wide enough to fit the slot. If it is not, a thin sheet of steel or tin can be wedged beside or upon the key to prevent any side play.

The Maxwell Motors Co. issue an instruction book which covers their car very thoroughly. Their address is Maxwell Motor Sales Co., Inc., Woodward and Warren Avenues, Detroit, Mich. If the book which they issue is not complete enough for you, we should advise you to purchase a Dyke's Encyclopedia.

A Real Mystery.

2557

From E. D., Iowa.—I have a 1916 Ford car which uses a great deal more water than it should, though I am sure the water does not leak from the radiator or the engine. After running this engine from 15 to 20 miles, nearly a gallon of water will be dissipated, though the engine does not overheat. Will you kindly give me your opinion on this strange case?

Reply.—Your problem falls into the same class with those presented by our friend Houdini, who, when placed inside a cell, double-locked, manages to escape. Since you are sure that the water does not leak from the system to the ground, or does not evaporate because of engine heat, there is only one possibility. That is, that the water leaks into the cylinders, and is vaporized and blown out through the exhaust.

Your trouble is in one way a blessing, and saves you money. At the present time there are upwards of one hundred devices on the market which are used to introduce water into the cylinders to prevent carbon. Your engine takes care of this in itself.

The only trouble seems to be, however, that the water leakage is too great. Remove the cylinder head and replace the gasket with a new one, and we feel sure that the water leakage will be reduced to a minimum. In replacing the gasket be sure that you coat it with a mixture of cylinder oil and graphite so as to make it watertight. Shellac will do, but does not answer the purpose as well as the graphite mixture.

Let us know the result of this repair, and if you are still in trouble we will write you again.

Broken Differential Part.

2558

From J. J. Crowe, Maine.—A few days ago while I was driving my Ford car, something seemed to snap in the rear and now the car will not run. If you think the trouble is in the rear axle, will you please tell me how to fix it?

Reply.—It is an easy matter for you to locate the trouble in your car. Jack up one of the rear wheels and have someone press upon the brake pedal. Try to turn the wheel that is free from the ground. If you find that you can turn it with little or no effort, it is an indication that one of the gears in the differential is broken or that there is a broken propeller shaft. If you find that you cannot turn the free wheel where the brake is engaged you may be fairly sure that the trouble is in the gear-set.

Digitized by Google

To make sure of this matter it is always best to try the above experiment, then move the car along a few feet and try it again.

It is very possible that one or two teeth are broken from the differential gears, and in this case the experiment would not be satisfactory. You should move the car along, then try the experiment a second time. The only way to make a repair is to renew the gears or the broken shaft, and to do this you will be obliged to remove the rear axle.

2559 Engine Would Not Start.

From H. A. Bill, California.—I have a 1915 Studebaker four-cylinder car, equipped with a Wagner starter and generator, a Remy distributor and a Willard storage battery. A short time ago I was unable to start the engine. When I turned it over by hand, I found that the ignition system gave a good spark, so I primed it, still no results. I called upon a repair man finally, and he started the engine in a few minutes, but I didn't see how he did it. Now if that same thing happens again, I would like to know how to start the engine and would like some suggestions from you.

Reply.—Probably your trouble was due to the fact that you did not spin the engine fast enough in starting it, and that some of the gasoline which poured in the tops of the cylinders collected on the plugs and short-circuited them. In priming an engine to start it, you must always be careful not to use too much gasoline. If you do, this liquid will cut the cylinder oil, and you will get little or no compression.

Probably what the repair man did to start your engine was to pour about two teaspoonfuls of lubricating oil in the top of each cylinder, removed all the plugs, spun the engine a few times to distribute the cylinder oil, cleaned the plugs and replaced them; then primed the engine with about one-half of a teaspoonful of gasoline to each cylinder.

If you have any further trouble with this engine be sure to examine the breaker points, which are located just beneath the brush of the distributor. See that they separate about the thickness of a visiting card and be sure that they come together fully when the roller is not riding on the cam. Sometimes the distributor points do not snap together quickly enough—especially when the spring is weakened or when the points are corroded.

2560 Heating the Carburetor.

From J. W. Cobie, Iowa.—I have an engine fitted with a carburetor which formerly was connected with the water jacket of the engine. Now this engine has no water pump and the water will not circulate in the carburetor jacket. Would it be practical for me to connect the carburetor jacket with the exhaust manifold?

Would it be advisable to run a pipe from the exhaust manifold through the intake manifold to heat the mixture?

How much weight will a magnet lift? Does it make any difference whether I use iron or lead for the weight?

Can I connect batteries with my K. W. magneto for starting?

Do I-head engines require a better plug than L-head engines?

Reply.—There should be no objection to connecting the carburetor water jacket with the exhaust manifold, as you suggest, provided you connect the outlet of the jacket into the exhaust line or run the outlet tube back for at least three feet beyond the carburetor so as to prevent any chance for the fire to ignite the gasoline.

We would not advise you to run the ½-inch pipe through the intake manifold, for you will cut down the size of the intake manifold greatly. In addition to this you will cut down the velocity of the gas passing through the manifold, which will give you unsatisfactory results.

There is no specific rule for the amount of weight which an ordinary magnet will lift—manufacturers only can give this figure for their type of magneto. All weights should be of cast iron because lead will not stick to the magnets.

Do not connect batteries with your K. W. magneto. They will damage the machine.

I-head engines require a spark plug that will stand more heat than L-head engines, for the reason that the plugs in the L-head engine are cooled by the intake gas.

2561 High and Low Speed Engines.

From J. C. Strong, Colorado.—Will you kindly tell me in your trouble department the physical characteristics of high and low speed automobile engines? The Chalmers manufacturers claim 3400 R.P.M. for their engine, and the Continental engines of the same size, stroke and piston claim only 2600. Why?

Reply.—Your question is best answered by telling the qualifications necessary for high speeds. Let us assume first that we have an engine fitted with heavy pistons and connecting rods, and a crank shaft of the old type which is not counterbalanced. We will assume that the pistons, together with the connecting rods and the crank pins, the latter purely theoretical, weigh one pound.

Let us see what happens when the engine is running at a speed of 1,000 revolutions per minute. Let us assume that the stroke of the engine is six inches, to make the example easy. For every revolution of the crank shaft the piston travels up and down, stopping, of course, at the end of each stroke. This means that one pound of metal must be set in motion 2,000 times per minute, and then this pound of metal must be stopped as many times.

Now, there are four pistons in a four-cylinder engine, which means four pounds for the total. The work which the engine must do then is to stop and start four pounds of metal 1,000 times each minute, and to move this metal at an average rate of 1,000 feet per minute; or, to state it a little differently, we move one ton of metal one foot in every minute at extremely high speed, then bring it to

Digitized by Google

a stop, theoretically; then we use a great amount of horse-power just for moving the pistons, to say nothing about the other losses in the engine.

Naturally, in moving all of this metal at these speeds considerable vibration results. Consequently this engine is limited in speed. By removing a slight amount of metal from the pistons and connecting rods, we decrease their weight one-half. Possibly we use aluminum pistons, or we cut down the size of the connecting rods. Then only one-half as much weight is moved per minute; therefore the engine can be made to run considerable faster. There is a limit to which we can reduce the weight of the reciprocating parts, however; but there is still left one more point at which we can economize, so to speak, and that is in the crankshaft.

One might say that a crankshaft in a four cylinder engine for instance balances itself. Taken as a whole, the crankshaft does, but you must realize that the crank pin in number one cylinder is distant from the crank pin opposite in number two cylinder from six to eight inches, possibly even more. In other words the crank pin for each cylinder taken by itself is out of balance.

The manufacturers of the modern high-priced cars, the Chalmers is one, if we remember rightly, counterbalance the crankshafts, that is they place a weight upon the crankshaft near the crank pin, so that it balances the weight of the pin, and makes each unit independent of the others. If you will investigate the weights of pistons and the counterbalanced crankshafts, you will find that the reciprocating parts upon the high speed engine are lighter than the reciprocating parts upon the low speed engines.

Have we answered your question? If not let us hear from you again.

2562 Battery and Magneto Systems.

From J. Harry Kelley, South Dakota.—Can I install a high tension magneto and still retain the generator on my car for lighting and starting? I have a 1912 four cylinder Cadillac which is fitted with a double ignition system. One system operates from dry cells, the other from the battery. The dry cell system does not give satisfaction.

Reply.—There is practically no choice between a battery ignition system and a high tension magneto, in the writer's opinion. It is simply a matter of personal opinion and the amount of money that you care to spend.

If we understand correctly, your car is fitted with two sets of plugs, one set operates upon the present battery and generator system while the other is fitted with a special dry battery system.

This second system may be discarded and the plugs connected with the high tension magneto.

2563 Worn Oil Pump.

From A. L. Chavalier, Ohio.—I have a model 79 Overland car in which the oiling system works poorly. If I stop the car and let it stand for a few minutes, then start again the oil will run in the gauge all right but it will not work when coasting or going up hill. When the oil stops flowing into the glass gauge I notice air bubbles coming from the tube. I have cleaned the system well but it makes no difference.

Reply.—The trouble with your model 79 Overland is that the oil pump is so badly worn that it permits the oil to leak through it.

We would advise you to replace the working parts of the pump, for there is danger of ruining your engine.

2564 Vibration in Ford Car.

From A. C., Connecticut.—I have a 1915 Ford car which has been run 22,000 miles and is in good condition. At speeds under 15 miles per hour the engine is quiet and runs smoothly, but on higher speeds there is a great amount of vibration; what might cause this?

Reply.—If you are not troubled by knocks in the engine, we doubt very much if the cause for vibration is due to ordinary wear.

We are inclined to think that the flywheel is not properly balanced. We would advise you to remove the engine from the car and see that the magnets are properly balanced. Perhaps one of the pistons is heavier than the rest. Perhaps also there is trouble in the drums with the transmission.

At any rate, the only way you can find the trouble is to remove the engine from the car. Before doing this, however, be sure that all the engine retaining bolts have been properly tightened.

2565 Engine Wrongly Timed.

From F. B. Perkins, Michigan.—I have an Overland car, model 83, cylinders cast separately. It is equipped with a Wilmo manifold, a Tillotson carburetor and a Dixie magneto. Am troubled by the engine overheating and on ordinary runs the water will boil in the radiator. This causes the engine to knock when accelerated and a very slow "pick up." Piston heads carbonize rapidly. Mileage has fallen from 17 to 11 miles per gallon.

All the valves have been ground, carbon scraped from the cylinders. Compression has never been better. The jackets have been cleaned and I am sure that the cooling system is not stopped up. Engine never smokes, and I have tried many kinds of the best oil sold with no noticeable change. At present the engine consumes about one quart of oil in every 500 miles.

As far as I know the timing has never been changed though I can carry the spark fully advanced at all times without causing the engine to knock. The muffler and exhaust line has been cleaned.

I have tried all kinds of carburetor adjustment and found that the engine sems to overheat more when hot air is fed into it. Can you help me?

Reply.—You have left but three possibilities for trouble and overheating.

Digitized by Google

First, it is very possible that the spark occurs too late and if this is the case, the timing must be advanced somewhat. First turn the engine over until the piston of No. 1 cylinder is at the top of the compression stroke. Both valves will then be closed and No. 1 cylinder will be ready to fire. Remove the cover from the Dixie magneto and see if the breaker points are starting to separate. If they are not, you will have to uncouple the magneto shaft from the engine and turn it in its direction of rotation until the breaker points start to open. Be sure that your spark lever is set in the fully retard position. To make this a little more clear, we will state that the points will be together in this position, but as soon as the spark lever is moved in the slightest, the points will separate.

When the setting is obtained, couple the magneto to the engine again. Remove the cover from the distributor and note under which terminal the brush is placed. Connect this terminal with the spark plug in No. 1 cylinder, then connect the rest of the wires in their proper firing order. With this setting, you should be able to advance the spark to its maximum.

Your second possibility for trouble is retarded valve opening. Be sure that when the engine is heated, the clearance between the exhaust valve stems and the tappets is not more than three one-thousandths of an inch. Then notice at what point in the piston stroke the exhaust valve closes for any one cylinder. The exhaust valve should close at approximately top dead center, and should open between 40° and 45° before bottom dead center.

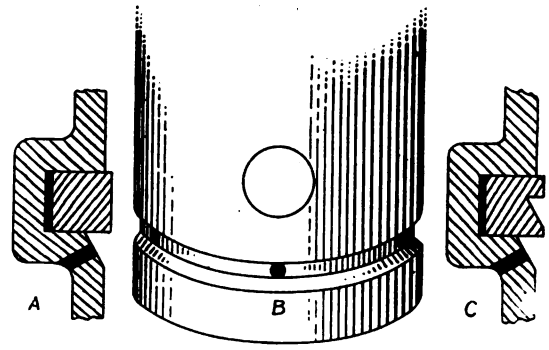
We doubt if your trouble is in the carburetor, and are fairly sure that you will find it to be due to a retarded spark or retarded valve opening. If you still have trouble after having followed our advice, let us hear from you, telling us what you have done, and we will advise you further.

Kindly let us know what condition the valve seats are in. It is possible that the valves have been ground into place so many times that the valves are below the surface and do not permit the exhaust gases to pass through them fast enough.

2566 Chalmers Planetary Transmission.

From T. A. M., Missouri.—I have a Chalmers car of the old type fitted with a planetary transmission. This car was purchased second hand and it looks as though the transmission had never been lubricated. Should it be oiled?

Reply.—This transmission should have been lubricated at all times with as light a grade of lubricating oil or grease as is practical without undue leakage. Wherever any unit is fitted with gears of any sort, lubrication is necessary. There are no bearings on the market which can be used without lubrication of some sort.



There is only one unit that can be operated without lubrication and that is a dry disc clutch, but even this requires oil in its bearings.

You may have to experiment considerably, but a light engine oil can be used in your transmission if the casing will hold it, otherwise use as light a lubricant as possible. If the casing is full of cracks or openings, you may have to use a medium or heavy grease, but be sure to give it some sort of lubrication.

2567 Spark Plugs Foul.

From L. J. E., Idaho.—I have a Hollywood Model Paige Car which gives me lots of trouble in that the spark plugs foul with oil very quickly. I have cut down the troughs as the manufacturers recommended but with no results. Would you advise the drilling of a series of small holes in the top piston ring groove? In your October number you have an article by W. O. Mann, in which is mentioned a type of ring, the "Always Tight." Are these rings sold by the Munger people? How many new rings should I install?

Reply.—In answer to your letter relative to a Paige car, first we should advise you to try a complete installation of leak-proof rings in your car. The rings which Mr. Mann speaks of in his article are those sold by the Splitdorf Electrical Co. of Newark, N. J., advertised in our October magazine on page 11, which you refer to.

Remedying Oil Troubles—Holes May Be Bored as Shown at A or B, Beneath Wrist Pin or in First Groove Above It. C Shows Special Ring and Hole.

In addition to this installation, we should advise you to bevel the lower edge of the piston ring groove, directly above the wrist pin, and bore a series of 1/16 inch holes 1½ inches apart, evenly spaced around the circumference of each piston. The face of the bevel should not be more than 3/32d of an inch, and the holes bored so that they will slant downward towards the inside of the piston. We feel sure that with the installation of the leak-proof rings and the boring of the holes, your troubles will cease.

2568 Starter Will Not Operate.

From A. T. Jones, New York.—I own a 1913 seven passenger Studebaker car and have just had new cells installed. When I put the lever to the starting position, the starting motor will not work. It seems as though the chain is not tight enough. Is there any adjustment for this? What do you think is the trouble?

Reply.—You may have any one of a number of troubles with the machine and to find them proceed in the following order:

Digitized by Google

First make sure that the battery is in condition and that the wires connected with it are not broken or grounded. Turn on the lights and if they burn you can be fairly sure that the wires are connected. Trace out the wires from the battery to the starting motor and see that they are not broken or grounded.

Clean the starting switch and see that all terminals are in good condition. Disconnect the two wires from the starting motor and have someone press down on the starting switch making the contact. Then with a small piece of wire touch the two ends of the wires disconnected. Snap the connection quickly, don't hold them together or the battery will be damaged. This experiment will show whether or not current is passing through the wires with the starting switch in.

If current is found to pass through the wires, connect one of them to its proper terminal and snap the other against its proper terminal, still holding the starting switch in. If you get a spark you know that the wiring is all right to that point. If not, evidently there is trouble in the starting motor. Examine the brushes and see that they rest on the commutator. If the brushes are all right and the current passes into the motor but motor shaft will not revolve, then you will have to take the motor to a motor repair man.

If the shaft revolves, however, but does not turn the engine over, the trouble is probably in the overrunning clutch which is keyed to the crankshaft and driven by the motor starting chain. You will be obliged to remove this overrunning clutch upon which is mounted the sprocket and clean it, replacing broken parts, etc.

The chain can be adjusted by moving the starting motor upon its hinge. If you cannot tighten this chain this way, remove a link. If you still are unable to find the trouble, advise us further, telling what you have done and what you have examined.

2569 Bosch Magneto For Charging.

From E. J. Peelman, Pennsylvania.—I have a Bosch, high tension, four cylinder type magneto. Is there any way that I can arrange this magneto for charging a six volt storage battery? I would like to run it with a belt and would like to know how fast it should be run.

Reply.—The Bosch magneto generates an alternating current, the strength of which varies with the speed of the magneto. This current would ruin a storage battery within a very few minutes or else the storage battery would ruin the magneto. Neither is there any way or any attachment made that you could use to enable you to charge the storage battery from a high tension magneto. The only thing that you can use this magneto for is ignition. The armature must be driven either by gears or by a chain at crankshaft speed which is equivalent to twice the speed of the camshaft. A belt cannot be used for driving the unit. Neither is the current from the magneto strong enough to operate the lights of your car.

We feel that it would pay you to attach this magneto to your Ford car and use it for ignition purposes only. The Bosch magneto people manufacture a fitting which will enable you to attach the magneto and drive it from the timing gears. This fitting may be obtained from the Magneto Parts Co., 1790 Broadway, New York, or direct from the Bosch Magneto Co., 223 West 46th Street, New York.

2570 A Sharp Metallic Knock.

From A. H. Christie, Nebraska.—I have a Hudson phaeton 1918 model and when this car is driven up even a small grade or hill on high speed the engine knocks with a sharp metallic sound. When going on the level at about 40 miles per hour it knocks also. I have had it to a number of repair men but they could not agree. One of them said that the compression was too great.

Lately on changing gears, they would grind and in changing from low to intermediate, considerable force is necessary. I find that by pushing the clutch only half out, the change can be made more easily.

Reply.—Your trouble with this car is due either to excessive carbon, a loose connecting rod or a loose main bearing. We doubt very much if the trouble is caused by excessive compression. Since the manufacturers of the Hudson car know just how high this compression should be, doubtless their designers have taken the greatest of care not to make a mistake in designing the cylinder head.

The writer is unable to say just why the change from low to intermediate cannot be made easily. He has found by experience that this same trouble is encountered upon many cars. It is possible that it is due to insufficient lubrication of the clutch throw-out collar which results in wear, and sooner or later the clutch does not spin as fast as it should upon its rollers. The little grease cup close to the change gear quadrant should be turned down very frequently. The new car owner frequently allows his car to stand on the curb with the gears in mesh but the clutch thrown out. Such a procedure results in excessive clutch thrust bearing wear and consequent trouble. We should advise you to examine this unit of your car.

2571 What Is Petroleum Ether?

From W. M. Schwingel, New York.—I have a Maxwell 1916 car and experience considerable difficulty in starting the engine on a frosty morning. My machine is equipped with a Simms magneto and regular type K carburetor. I notice that the 1919 models have Atwater Kent ignition and I think a Johnson carburetor. Would you suggest that I change my equipment? The engine starts easily after it is heated.

Could I use some other ignition system, the Delco for instance, on this car? I appreciate that the present day grade of gasoline is in a large measure responsible for my trouble but not all of my acquaintances have the

Digitized by Google

same trouble in starting their engines as I do. Many garagemen have said that it was characteristic of old cars, to start hard.

Can you inform me where I can procure petroleum ether? I have tried at a number of drug stores but to no avail. Most of the druggists say that there is no such thing.

Reply.—Your letter to a certain extent answers itself, as far as the difficult starting is concerned. You state that immediately the engine is heated it starts easily, which proves conclusively that the trouble is not in the ignition system.

Very probably the manifold on this car, or we should say the intake system is not designed as well as the later types of cars. We doubt if your trouble is in the carburetor. Very probably in starting the engine on the cold mornings the gasoline is condensed before it reaches the explosion chamber. The only two remedies are priming and heating.

We should advise you to investigate priming and heating devices, and install a priming device in your engine, or arrangement of some sort of a manifold heater.

We are not able to advise you authoritatively concerning the product which you term "petroleum ether." There are two general groups of hydrocarbons. One group is distilled from vegetable products—the other from mineral oils. From the first group, if we remember rightly, are extracted the methol spirits, and it is from this group that sulphuric ether is taken. The second group, if we are not mistaken, is headed by the more volatile elements of which benzine is the highest.

If there were such a thing as petroleum ether, it would be a very distilled product from the second group. It would be classed, probably under the heading of benzine.

Sulphuric ether is extracted from the methol group. As far as we know, the derivatives from the methol group of which sulphuric ether is one more volatile than those from the second group or the benzines.

The writer always found that sulphuric ether was volatile enough to explode an engine even on the coldest day.

Removing Scale From Cooling System.

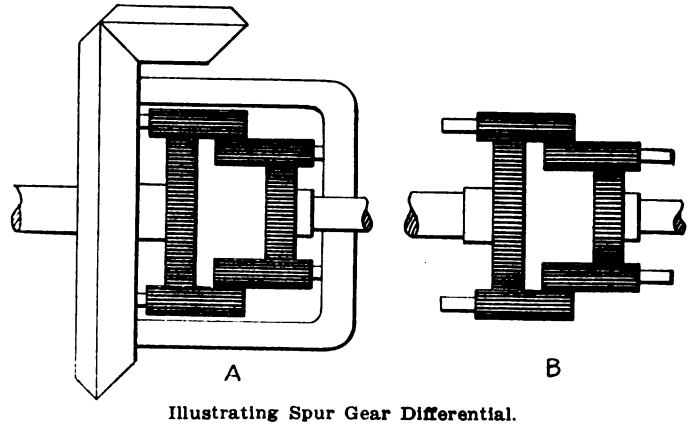
2572

From E. J. Kuebel, Texas.—I have a Ford 1914 car which is fitted with an air friction carburetor. When the car is being driven from eight to ten miles per hour the cooling water in the system is boiling hot. As far as I know everything about the engine is O. K., the carbon has recently been removed, and the valves fixed. It is possible that some scale is formed in the water jacket. How can I remove this scale? Do you think that this is the whole trouble?

Reply.—Your trouble is undoubtedly due to deposits of scale, etc., in the radiator system. This scale or deposits can be removed by either or both of two methods.

Mix up a strong solution of potash, lye and water. Strain it through cheesecloth to remove the dirt and the lumps, and drain off the water from the radiator system. Fill it with the potash-lye solution and let the engine run for five or ten minutes until it has thoroughly warmed. Let it stand for about fifteen minutes, and start the engine until it has heated again. Drain off the solution and flush the radiator and water jackets well with water. Turn the hose right into the radiator, if possible, and let it run for ten minutes in order to remove all traces of the potash solution; then refill with clean water.

If the engine still overheats mix up a strong solution of washing soda and water, strain it through cheesecloth, and use it in the same way as the potash solution. After this treatment it is best to replace the rubber water connections with new.



Before applying either of the solutions, if it is possible, we should advise you to clean the water jackets with a long flexible iron, scraping off as much of the scale as you can. If you still have trouble after this treatment, let us hear from you again. Be sure to tell us how the engine is timed, that is, at what point of the piston travel the exhaust valve opens and closes.

Spur Gear Differential.

2573

From W. B. Hiler, Texas.—I would like information concerning the action and construction of the spur gear differential.

Reply.—We give herewith a diagram to illustrate the

Illustrating Spur Gear Differential.

principle. The driving gear is riveted or bolted to the differential housing just the same as any ordinary differential. Inside the differential housing the differential gears on the ends of the two axles are spur, rather than bevel. These gears are shown on the sketch at A. Each of these gears meshes with a spur pinion gear as shown at B, and these spur pinion gears overlap each other and mesh.

There may be three or more sets of pinions. The pinions are mounted upon studs and the studs are fastened to the differential housing.

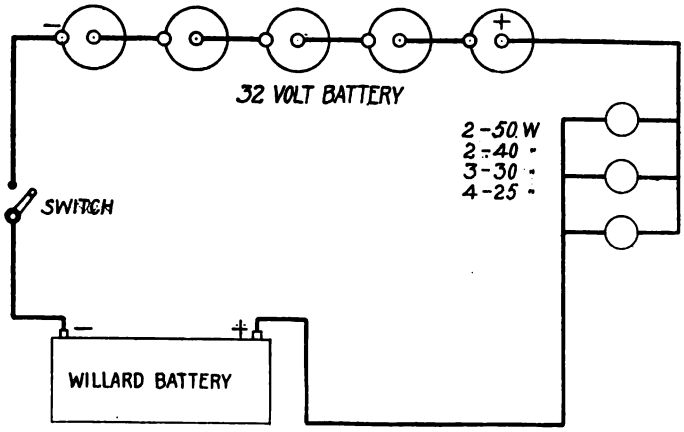
Ignition for Stationary Engine.

2574

From C. A. Williams, Oregon.—I have a stationary gas engine 7½ by 10 now fitted with a make-and-break

Digitized by Google

ignition system. I want to rebuild it and instal a jump spark plug system, but have been told that such a system would not work well on so large an engine. Will you advise me?



Reply.—We see no reason why you cannot use the jump spark system upon this engine, providing you can find some means of installing the spark plug at approximately the center of the combustion chamber, or over the intake port. The spark plug which you use must extend into the explosion chamber. A short plug will not give you satisfaction.

If we are not mistaken you can obtain these long plugs at an accessory sales room to fit any standard thread. You can use any vibrating coil, or any jump spark coil together with batteries for this system.

If you desire any information relative to timing the engine, or installing such a system do not hesitate to call upon us.

2575 Charging Battery from Edison System.

From W. F. Marsden, Iowa.—I have an Edison lighting plant in the basement, a 32 volt system, and would like to charge the battery of my automobile from this

Charging Willard Battery from Edison Battery System.

system. My automobile battery is a 6-8 volt Willard. Will you please send me a diagram and directions?

Reply.—We give herewith a wiring diagram showing how you can do this together with the sizes of lights to be used for resistance. As we can find no information relative to the connections of this lighting plant, we can only tell you to connect the positive terminal of your storage battery with the positive terminal of the Edison plant and the negative terminal of the Edison batteries through the resistance to the negative terminal of your storage battery. The switch may be put on the positive side as shown in the diagram.

2576 Headlights Burn Poorly.

From W. E. Stainback, North Carolina.—I have a model 11 Dort car, practically new. The first time I used the lights, I noticed that they burned irregularly, that is, bright for a few minutes, then dim, whether the engine was running or not. The engine runs smoothly and the starting motor works all right. I have been told that the generator is too strong. What do you think?

Reply.—Your trouble is undoubtedly due to poor connections in the lighting system, or grounded or short circuits.

We would advise you to examine the wiring connections at the lighting switch, and trace the wire which leads from the lighting switch, to the fuse box, and from wire connections are poor. Let us give you the circuit from the battery to the lights.

Current passes from the battery to the starting switch, and at the starting switch a wire carries the current to the ammeter. From the ammeter, the current is carried to the ignition, and lighting switch. Since you say that the ignition system is all right, the wiring to this point is correct. A common connection carries the current from the ammeter to one pole of the ignition and lighting switches. From the lighting switch, current is carried to the fuse box. At the fuse box wires connect from the tail lamp and from each headlight, and the current passes from the fuse box to each lamp, thence to the ground.

If all of the lights burn irregularly, you will probably find your trouble in the lighting switch or in the fuse box. If you still have trouble, let us hear from you again, and we will try to reply further.

2577 Ford Clutch Assembly.

From E. B. Council, North Carolina.—I have recently overhauled my Ford car and now the clutch discs stick. The Ford manual says: first put in a large, then a small and alternate, ending with a large plate. This leaves no disposition of the thrust plate. The instructions by Manley say: First put in a distance plate, then add a small disc, then a large one, etc., and finish with a large disc on the top, but this only accounts for 25 plates.

I followed Manley's instructions and added another distance plate, making a total of 26 plates. I started the engine but in about five minutes the clutch stuck. Would it matter if more than 26 plates were used? If two of each kind were put in alternately, would the clutch stick?

Reply.—You were right in putting a large plate in the drum first. Against this should be placed a small one and so on until the 26 discs have been used up. There should be 26 discs in addition to the master, or distance ring, and if you assemble it correctly, that is, place a small disc against the distance plate first, you should end with a large plate. Figure it out for yourself on paper, or use 13 small matches and 13 large ones.

Since you did not come out even, evidently you made a mistake and put two discs together. Even so, we fail to see why the clutch should stick, unless the keys which carry the discs have been worn unevenly. If you ended up with a small disc, the plates would probably stick anyway. You have added one extra plate, if we understand your letter correctly, which probably means that there is no chance for the plates to expand and release.

Digitized by Google

Our only advice to you is that you remove the clutch unit and do the work over again. Examine the inside of the drum and be sure that it has no edges which will catch the discs.

Carburetor Does Not Leak.

2578

From A. W. Dahlin, Connecticut.—I have a Hudson 1912, model 33 car, formerly fitted with a Stromberg carburetor. Every time I stopped the engine I noticed a leakage of gasoline from the carburetor. I thought perhaps the carburetor was so old that it was worn out, so I purchased a new one, but the trouble still exists. Do you think it is the fault of the carburetor?

Reply.—There are two reasons why you should notice a leakage of gasoline around your carburetor. As far as a carburetor is concerned, if this is a new one, you probably will find no trouble with it. You may find, however, in connecting this to the fuel line, the joint has not been packed tightly enough.

The second possibility is that there is a hole in the fuel line at some point and the gasoline follows the fuel tube along to the carburetor where it drops. Of course you would not notice this under ordinary conditions only when the car is stationary. We should advise you to examine the connections at the tank and in fact the whole fuel line.

Platinum Points Burn.

2579

From D. A. Jamison, South Dakota.—Will you kindly tell me what causes both points in the breaker box of a high tension magneto to pit? (Usually, I should think that one point would pit, the other would build up.) Is there any way to change the direction of the current or change the wiring so as to reverse the current and prevent pitting?

Can the current from a Ford magneto be reversed to stop the points from building up or pitting?

Reply.—Excessive pitting of breaker points can be traced usually to broken condenser connections. Occasionally one finds that the condenser is not large enough to take care of the excessive current, but this is a fault of the design and occurs but seldom. The magneto system, including that of the Ford, operate upon alternating current, and since this current changes its direction of flow with every cycle, there should be no building-up action upon either of the points of the breaker box.

Since the current is alternating there is no way of changing the connections so that the current will flow more in one direction than in the other. In the battery systems, however, where special batteries are used for ignition purposes, the building-up action may be reversed by reversing the battery connections. Where the battery is used in conjunction with the starting and lighting system, the current flowing through the ignition unit cannot be changed by any practical method. The only remedy is to replace the points in question.

Carburetor Leakage.

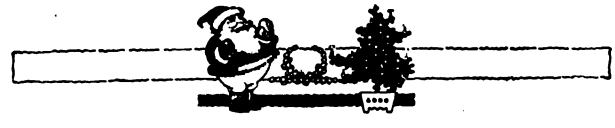
2580

From W. A. Hoffman, Pennsylvania.—I have a 1917 Lexington car fitted with a Rayfield carburetor. This carburetor leaks gasoline and does not give good results. Will you kindly tell me how to fix it? There is a light click in the engine, possibly in the valves, which seems to disappear at high speeds.

Reply.—The trouble with your carburetor evidently is that the float level is too high, or there is a leak in the float valve, or base of the carburetor. The garageman should be able to repair the carburetor if you call his attention to it.

The level of the gasoline should be about one-eighth of an inch below the needle valve or jet opening. If your carburetor is not working properly, it is very possible that your trouble is due to faulty construction. There is little that you can do in the way of adjustment, and we should advise you to take the matter up with either the Rayfield agency, or the agents for your car.

The possible troubles are: wrong link connections between the metering pin and the butterfly valve, or poor linkage connections between the air inlet and the dash pot, or it is possible that the dash pot plunger is not properly fitted.



The clicking noise which you hear is probably due to improper valve clearance. After the engine is heated, examine the valve clearance between the valve stem and tappets, and be sure that this distance is not more than three one-thousandths of an inch in any valve. In making these adjustments, turn the engine over by hand until one of the valves has opened, and closed, then turn the engine one-half turn further, then adjust that particular valve. Do the same for all of the valves.

You may find that you have to run the engine after adjusting the first three valves so as to heat it again. If you still have trouble, let us hear from you again.

WHO IS RESPONSIBLE FOR THE ACCIDENT, THE OWNER OF THE CAR OR THE DRIVER?

HERETOFORE, in many cases where accidents have been the result of fast or careless driving, the owner of the car has shifted the blame successfully to the chauffeur.

By two recent court decisions, it has been held that the owner of the car is the man who is responsible. It is his business to check the chauffeur if he is driving too fast, exercising such control over him at all times as will prevent accidents through carelessness. Unless he does this he will be liable to damages through the courts. There has been and is altogether too much careless driving and something should be done to stop it, or at least to curtail it.

An Interesting Interview With Charles Johnson Post

In analyzing the Congressional returns, Charles Johnson Post, director of the Publishers' Advisory Board, in an interview today stated that the Republican gains were the result of the mistakes and un-American policies—and specifically his opposition to the war and his vicious postal zone law blunders—in Congress of the Democratic majority leader, Congressman Kitchin of North Carolina.

"Mr. Kitchin," said Mr. Post, "at no time since the world war started understood or represented the great and fundamental American thought. A chart prepared by the National Security League Congressional Committee shows that seven out of the eight important bills relating to our war activities for the inevitable and righteous part that the United States was to play in the establishment of human rights were opposed by Congressman Kitchin and his vote was recorded against them. Congressman Kitchin voted against the declaration of war with Germany; he even voted against the Kahn amendment by which our army was to be raised after the war was declared. Mr. Kitchin was not an ordinary member of Congress giving expression to his individual views of personal pacifism or personal righteousness; he was the responsible leader of the majority party representing the Administration on the floor of Congress.

"This incredible style of leadership and thought laid the foundation for Congressional Democratic defeat. And the first opportunity registered the protest of the people against Kitchin and Kitchin methods in Congress. It is Mr. Kitchin himself who has defeated the Democratic party by persistent dullness and lack of vision.

"Mr. Kitchin's incapacity for leadership—which a mere seniority thrust upon him—is proven by the manner in which he used the War Revenue Act of 1917 as a means of punishing all the publishers—and their millions of readers—of the United States because they denounced him for his opposition to this war and his attempts to hamstring President Wilson's administration by voting against war with criminal Germany and opposing the draft that gave us our splendid American army. To illustrate:

"The War Revenue Act of last year dealt solely with the means of raising war revenues to train our armies and support them in the field. Yet into this purely war revenue measure Congressman Kitchin injected a postal amendment which he himself admitted, on the floor of Congress, *was not war legislation, but permanent postal legislation.* As postal legislation such a bill would have properly been referred to the Committee on Post Offices; but, by virtue of his power as majority leader of Congress, Mr. Kitchin, as chairman of the Ways and Means Committee, had this amendment introduced into the War Revenue Act and through his own committee denied the opportunity for discussion and hearings.

"Moreover, this proposition, known as the postal zone amendment, after full hearings and investigation, had been *twice defeated* in the United States Senate *at the same session of Congress.* This law resurrected a postal zone system that was abolished by President Lincoln; a zone system that has been denounced by every U. S. Postal Commission since then. Mr. Kitchin forced this destructive, vicious and un-American postal law into the War Revenue Act and went to the Senate Conference Committee and compelled its acceptance; since this emergency war revenue bill could not be delayed, it was thus that the vicious zone system was successfully jammed in by Mr. Kitchin.

"This destructive and un-American zone law divided the country into postal zones, with progressive and heavy increases of postage on periodical reading matter, according to the accidental remoteness of American citizens from the zone of publication. It meant that the great farming districts of the West—Kansas, Nebraska, Ohio and California—had to pay a heavy penalty postage upon their periodicals when that identical periodical was charged less postage to other American readers accidentally closer to the point of publication.

"So unpopular did this law immediately become that all over the United States boards of trade, chambers of commerce, granges and agricultural associations, civic bodies, libraries, cultural and educational institutions, religious organizations, to the number of almost seven hundred, began registering emphatic protests against this absurd zone law and demanded its repeal; Congress was deluged with petitions and letters of protest—which Mr. Kitchin ignored in framing the new war revenue bill which is now pending.

"The Congressmen—outside of the solid South—that had blindly followed his lead came mainly from the Middle West—Illinois, Indiana, Iowa, Kansas, Missouri, Nebraska and Ohio—and it is in these states that there is perhaps the greatest number of readers of periodicals. Twenty-four colleges of Illinois at a joint meeting demanded that Mr. Kitchin's destructive postal zone law be repealed. The National Educational Press Association, with headquarters in Nebraska, at its convention promptly did the same.

"That this postal zone law was an important factor in this Congressional election is clearly shown by the Congressional returns—particularly in these states above named. Fifty-nine Congressmen who voted for the unfair postal zone law were defeated for re-election, as returns to date show.

In California three pro-zone-law Congressmen were defeated.

In Illinois three pro-zone-law Congressmen were defeated.

In Indiana four pro-zone-law Congressmen were defeated.

In Iowa two pro-zone-law Congressmen were defeated.

In Kansas five pro-zone-law Congressmen were defeated.

In Missouri four pro-zone-law Congressmen were defeated.

In Nebraska four pro-zone-law Congressmen were defeated.

In Ohio six pro-zone-law Congressmen were defeated.

In other states the number of pro-zone-law Congressmen who were defeated was rarely over one.

"The non-partisan character of the returns in these significant states is clearly shown by the fact that five Republican pro-zone-law Congressmen were defeated and twenty-three pro-zone-law Democratic Congressmen. The greater number of Democrats suffering defeat is easily accounted for by Mr. Kitchin's lining them up to serve his reactionary and unvisioned 'leadership.'

"This comparison speaks for itself. The recent Congressional elections were no repudiation of President Wilson's administration; it was a rebuke to the jumble of war-time legislation expressed by the reactionary Mr. Kitchin of Scotland Neck—of nearly 2,000 population. Mr. Kitchin sought to punish publishers, and to do this he was willing to penalize every American home. He only succeeded in hacking his party and hamstringing President Wilson. Mr. Kitchin took no political risk in attempting hamstringing tactics, since he represents one of those Southern districts that would return a Democrat under any circumstances. But Mr. Kitchin and his dimlit Kitchinism have received the humiliating rebuke of public condemnation."

The People Whom I Employ

BY LESTER G. HERBERT.

I HAD not been long in business for myself before I discovered that some people about me had a much better faculty for getting along with their employees than others. Some were always having disturbances, being left short-handed, and handicapped at most inopportune times for very much needed assistance, while others seemed to run along, year in and year out, without any difficulties of this kind.

It didn't seem possible to me that this was merely the result of chance or luck, and as I anticipated a long business career ahead of me, and hoped to be reasonably successful, I decided to keep a notebook on "How People Get Along With Their Help." In this notebook I jotted down from time to time conclusions and deductions. The good ones I put to work, and the ones of which I did not approve I used as a warning to myself to keep me out of trouble. In the course of a few years of this method I evolved, for myself, a set of rules which I unconsciously followed, and which have guided me for a number of years with such success that I believe I am justified in giving them to others. Personally they have been weighed and found "not wanting."

Several times men have been employed by myself and others who had to be persuaded, or, as it were, "baited" to accept the position. The relationship was never satisfactory nor long-lived, so I believe I am right in laying down the rule that the connection should be thoroughly agreeable in the beginning.

Hire the "Stickers."

Next, I never hold onto a man when he shows a disposition to make a change. I may possibly have a frank talk with him and discover his points of dissatisfaction. If they are reasonable, I do not feel that I compromise my dignity in any way to correct those conditions, but I never "hang onto" a man who shows a restive spirit, for I have found that if I satisfy him apparently by special and unwarranted concessions, that he does not remain satisfied very long. In short, cordial co-operation is only possible where there is no underlying dissatisfaction.

Next, I encourage my help to tell me where and how they can improve the work they are doing, in their opinion. I have learned that this gives them a greater interest in their tasks, and it is natural that the man who is doing a thing will think about it and concentrate upon it, and sometimes have constructive ideas to offer. To treat these as of no account is to discourage initiative and to chill enthusiasm.

Keep Up Interest.

I make a point of having ample time for conferences with each man about his work and to take an interest in him and his affairs, and also to plan some general get-together times, but unless the case is exceptional, I have found that too close intimacy between the business principal and the men he employs is undesirable. This is not because "familiarity breeds contempt," so much as that we are apt to place a less high value on the good opinion of those with whom we are too much. And the man who employs others to work for him must always be careful as to partiality. Then, there are always some who will take advantage, perhaps without meaning to do so, and be less inclined to yield to the necessary business discipline.

Another important point which I have incorporated into my platform is that about once in so often I make it a point to have a heart-to-heart talk with each man who works for me. If he has any faults which are lowering his efficiency, making results less than they should be, or is unconsciously falling into any errors of management, I point this out in a tactful way which does not arouse resentment.

Give Praise When Deserved.

On the other hand, if I have discovered, as I often do, points of special excellence, have noted conscientious effort, or unusual results, I take pains to give credit and cordial praise. I believe this habit has made more dollars for me than anything else, and that I may never forget to have these heart-to-heart talks, I jot down in my pocket notebook the facts of each one and when I plan to talk to him again. These talks are not, of course, in the nature of a curtain lecture, and oftentimes they are so arranged that the employee does not know that they are more than a casual conversation which just happened.

I take pains that the best trade literature in my line is within the reach of my employees, and I often read an article and purposely mark a paragraph or a sentence and give it to one of my men, saying, "Read that and give me your opinion on the article." Perhaps I care less for his opinion than to be sure that he reads it.

Be Thoughtful.

I am particular on another point concerning which some employers are careless—that is, I see to it with a reasonable degree of thoughtfulness that preferences are not ignored. For example, Howland always gets his vacation in June. That is the anniversary of his wedding, and he and his wife go to her people's and something in the nature of a celebration is enjoyed. It would be a serious disappointment to Howland to have his vacation earlier or later.

With the same thought of individual likes, Wilson is always provided with a light of a special type for dark days, as he has a peculiarity of eyesight which does not trouble him if he has the right sort of a light, and which,

Digitized by Google

causes distressing headaches if he suffers the least eye strain.

Unless circumstances are unusual, my men have regular time upon which they can depend for themselves, and which seldom varies more than a few minutes one way or the other.

Personal Gifts.

I see to it at Christmas time that they are suitably remembered, and also keep in mind that men are better satisfied when they realize they are making some advancement in a personal way. From time to time I give the most trusted extra responsibilities, or require additional tasks of them, always balancing up with a little better pay.

I have found that many a man grows dissatisfied because he feels he is little more than a cog in the machine, so I strive to impress each with the thought that his work means a good deal to me. On the other hand, it is unfortunate for a man to get the idea that all business would stop without him, for it is a rare individual indeed whose place cannot be refilled.

Frequently when I find that I am facing a special difficulty, I ask one of my men whom I especially trust, or several of them, for suggestions. On a number of occasions I have had reason to know that this has averted the losing of a good man, for he has respected my confidence and evidently argued to himself, "I couldn't leave just in this crisis," or "We must all pull together."

Retain Discipline.

Getting along with one's help means a peculiar finesse which is a skillful balance of firmness and freedom, of appreciation and requirement, of ambition and caution, of interest and aloofness. To explain the last, I might say that during business hours I have found it invariably advisable to hold to business interests, even in conversation, otherwise discipline and loyalty would be threatened sooner or later.

This article was written for our readers who employ men, but should be of equal interest to employees, for they may read it and gain many lessons thereby. Be square with your employer, and he will be more apt to be square with you.—Editor.

NEW AND INTERESTING THINGS IN MOTORDOM

Pattern and Tool Plant Sought by Louisville, Ky.

It is announced by Tampton Aubuchon, general manager, that the Million Dollar Factory Fund of Louisville has appointed a special committee, composed of representatives of a number of large manufacturing concerns, for the purpose of negotiating with manufacturers of tools, dies, wood and metal patterns, with the view of establishing a tool and pattern plant in the Louisville industrial district.

The need of a local high-class pattern and tool shop is accentuated by the unprecedented growth of fifty-nine metal working plants in the Louisville industrial district during the past few years.

The committee has begun negotiations with a number of large tool and pattern concerns and it is believed that the necessary arrangements for the establishment of such a plant in Louisville will be consummated at an early date.

The Lo-See Hot Spot.

The principal reason why gasoline does not give the mileage today that it did a few years ago is that it does not vaporize so rapidly. In order to vaporize present day gasoline, considerable heat is necessary. Owners of old cars cannot always apply devices which are on the market because the design of their engine does not permit.

There is one fitting, however, which should be investigated by every car owner. It is sold by the Wee Specialty Co., 1806 Michigan Ave., Chicago, Ill. This fitting is clamped between the carburetor and the intake manifold, and is really a hot air stove. Hot gas is taken directly from the exhaust manifold and carried to the fitting. Gas passes around the fitting and is carried backward away from the carburetor.

The outside of the fitting is corrugated or fitted with fins to absorb the heat. Inside a peculiar arrangement of fins serves the purpose of heating the ingoing mixture of gasoline and air. A wedged-shape casting at the center of the fitting serves the purpose of heating the center of the passing gas. In this way there is no danger of unvaporized gasoline working into the combustion chamber.

The Dearborn Truck Company.

This company has recently purchased the good will and all materials of the Smith Motor Truck Corporation and intend to remove the same to their recently acquired factory building located at 2515-2535 W. 35th St., Chicago.

The general offices of the Dearborn Truck Co. are being moved to 2015-2017 South Michigan Ave., and will occupy two floors. The ground floor will be devoted to the display of their new models, while the second floor will be occupied by the sales, accounting, purchasing and advertising departments.

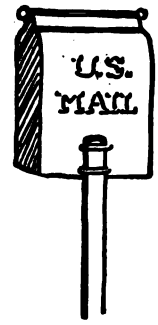
The Dearborn Truck Co. have recently added to their complete line of truck units the Dearborn Complete Worm-Drive Truck in two models: Model "F" 1½ ton, and Model "H" 2½ ton capacity; also the Dearborn Complete Chain-Drive Truck in two models: Model "A" 1-ton and Model "B" 2-ton capacity.

The latter two additions now give the Dearborn Truck Co. a very exceptional line of completed trucks and truck units which we know will receive recognition from the automobile trade.

Hammered Piston Rings.

An engine is usually known by the quality of its rings. It can be in the best of condition, but is worthless if the rings do not fit, or if they permit the gas to pass the pistons. The Hammered Piston Ring Co. of America, located at Newark, N. J., manufacture a piston ring which is without doubt among the first in quality of those made.

Ordinary piston rings are made from gray iron. The cheaper grades are simply machined. By hammering or peening a ring, a quality is imparted to it that can be had by no other means. By this process the metal is made tougher and more resilient. A hammered piston ring exerts an even pressure upon every portion of the cylinder wall. It does not age with use; that is, does not assume a permanent position, but retains its resiliency a great length of time.



This is the type of ring that is manufactured by that firm whose address is given above. Heretofore this firm has devoted practically 100 per cent of its production toward winning the war. Their products were chosen for use in government engines which is ample proof that a hammered piston ring possesses much merit.

Hess-Bright Ball Bearings.

We are pleased to acknowledge the receipt of a book issued by the Hess-Bright Mfg. Co. entitled "The History and Development of Ball Bearings." This book tells and illustrates the use of Hess-Bright ball bearings in the automobile, in the airplane and in various machinery units. Our readers who are interested in the installation of ball bearings surely should write for this book. This company has a main office at Philadelphia, Pa.

Do not lose any time

You'll need carburetors

when spring comes. It's going to be easy to sell good carburetors. It may not be so easy to get them.

But you know that any

Rayfield carburetors that you can lay your hands on are as marketable as gold dollars. Suppose you try ordering some in advance—and don't say we didn't warn you.

Service Stations and Dealers everywhere.

The Hoyt Rotary Meter.

The Hoyt Electrical Instrument Works of Pennacock, N. H., recently put upon the market a product called the Hoyt Rotary Meter, which is a volt ammeter, and trouble detector combined. It is claimed that this device when connected with the starting, lighting and ignition system of an automobile, will not only give the rate of current consumption as ordinary meters, but will give considerable more information, such as the voltage of the storage

Hoyt Rotary Meter.

battery, the voltage of each individual cell, and the current required for the starting motor.

In addition to this, the device can be used to detect leaks, grounds, short circuits or open circuits in armatures, fields or commutators of motors and generators. Everyone who is interested in the repair of automobiles should investigate this device which should prove to be "the trouble-man's right-hand partner," if we may use the expression. As a matter of fact the device should be of interest to anyone interested in automobiles.

Home Repair Guide Free.

The Miller Rubber Company, Akron, Ohio, has brought out a booklet entitled, "Guide to More Tire Mileage," which they say gives just the information which every car owner needs to know about repairing so as to make tires wear as long as possible. We understand that a copy of this book will be sent free of charge to any reader who will mention the Automobile Dealer and Repairer when writing for it. It would seem to be well worth sending for.

F. W. S. Roller Bearings.

Ever since the Ford car was placed upon the market many years ago, car owners and repairmen have been in search of some sort of a bearing to replace the ball bearings in the front wheels of this car. F. W. Stewart, 1406 Michigan Ave., Chicago, Ill., in putting on the market the F. W. S. improved roller bearing, answered the problem.

This roller bearing can be used both in Ford and Chevrolet front wheels as a replacement part for the old fashioned ball bearing. The inner race or cone is made of a specially prepared steel carefully hardened and ground to the correct size.

This part fits upon the Ford or Chevrolet front wheel spindle in place of the regular cone. Upon it are mounted the large rollers which are contained in a strong steel cage, which is reinforced by a heavy turned edge. Surrounding the roller and cage assembly is the outside race or ring which, like the inside cone, is carefully ground and hardened.

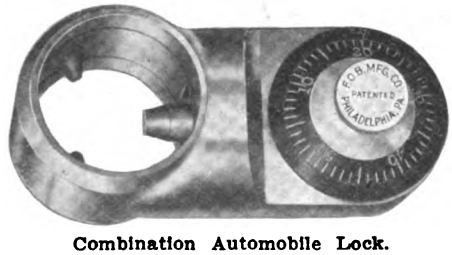
Autoists who find that the ball bearing in the front wheels of their Ford or Chevrolet cars are rapidly destroyed by wear, should investigate these bearings. The cost is low and satisfaction is guaranteed.

Duplex and Simplex Governors.

Invariably when one investigates the cause for truck dissatisfaction, one finds that the primary cause for trouble lies in the fact that the driver has attempted to run the machine at passenger car speed irrespective of load or road conditions.

The owner or manufacturer can hardly control his drivers when they are on the road. He can make rules, but the drivers will not follow them. There is only one means that he can adopt to prevent overspeeding of his truck, that is to install a governor.

The Duplex Engine Governor Co., Inc., 36 Flatbush Ave. Extension, Brooklyn, N. Y., manufacture governors for internal combustion engines. These governors are applied between the carburetor and the engine at any convenient point and are so arranged that they cannot be tampered with or disconnected without the knowledge of the owner With one of these governors attached, the truck owner is sure that his machine will not be driven above a certain speed.



The governors made by this concern control the speed of the engine to a predetermined limit without decreasing the power. When the car is stationary or fully loaded the governor does not prevent the use of all the reserve power in the engine.

Every truck owner should investigate such equipment for his machine. It amounts to insurance upon his equipment as a governor is a guardian of safety and reduces the cost of upkeep as well as saves the cost of repair bills.

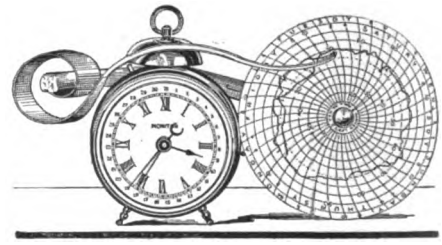
Combination Automobile Lock.

One would never think of leaving a bundle of bills upon his desk with no one there to guard it, nor would he think of leaving any money in the corridors of his office building. That same person does not hesitate to leave his automobile on the street unguarded and unlocked. Many manufacturers have tried to build an automobile lock and many of them have failed, but the F. O. B. Mfg. Co. of Philadelphia, Pa., have produced a device which would seem to solve the problem.

This device, which is illustrated here-

Combination Automobile Lock.

with, is a combination lock, and requires no key. It consists of a heavy casing of aluminum alloy which is mounted upon the steering column of the automobile. At one end of this casing is fitted a combination dial. Inside the device and resting against the tumbler of the lock is a bolt pin which extends into the steering column against the steering shaft.



When the tumblers are set at the proper combination this steel pin falls back and releases the steering shaft so that the car can be steered in any direction. When the steel pin is locked against the steering post or shaft, however, the wheels are held rigidly, and the car cannot be driven or towed except in a straight line.

Manifestly, a thief cannot go very far with such a car. The combination feature is interesting for the reason that one need not carry a key. The aluminum alloy of which the device is constructed is said to have a tensile strength of over 30,000 pounds to the square inch; therefore there is no danger that the lock will be broken by the thief.

Heatrec.

The Duryea Laboratories, 18th St., Philadelphia, Pa., have put upon the market an interesting device which should be installed in every garage where automobiles are stored. The device is known as "Heatrec," which is really a recording thermometer. It furnishes a permanent record of the temperature in your garage during the specified time.

There can be no dispute should radiators freeze while they are on the road. If you keep your garage above the freezing point, Heatrec furnishes a record which

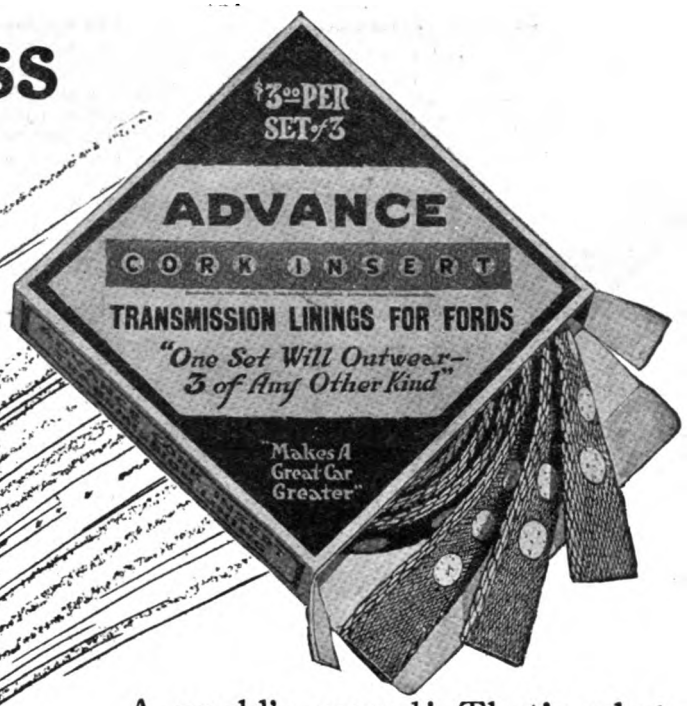
Heatrec.

proves your statements. Heatrec shows the temperature at all times and by comparison one can tell whether or not the heat is rising or falling in the garage.

While the regular thermometer only tells existing conditions, Heatrec shows conditions which existed during a period of time passed. Therefore it is indispensable in keeping the temperature even.

Two "Yankee" Books.

North Bros. Mfg. Co., N. E. Cor, American St. and Lehigh Ave., Philadelphia, Pa., have just issued two interesting booklets, one of them entitled "Yankee Tools in the Garage," the other "Yankee Tool Book." Both of these books describe the various up-to-date labor-saving tools manufactured by North Bros., and illustrate them fully.



For many years North Brothers have made celebrated tools of many kinds; tools that are indispensable to the automobile repairman, or the mechanic. Every one should write for these booklets, which will be sent free to our subscribers.

Martell Reamer Correction.

In the November issue of the Automobile Dealer and Repairer, on page 64, we described the Martell line of reamers manufactured by the Taft-Peirce Mfg. Co. of Woonsocket, R. I., and made special mention of the Martell aligning reamer for reaming main bearings. The wrong illustration was used for this article. We showed one of the small hand reamers instead of the larger ones. The Taft-Peirce Mfg. Co. are marketing Martell reamers, which are designed for practically every reaming operation. The line is extremely large and adaptable.

Biggest Success in the Ford Lining Field

A world's record! That's what Cork Insert made when it won a place on hundreds of thousands of Fords within a few short months. It broke all selling records because it gave a better performance than anything else ever produced—*smoother action—a safer brake—and longer wear.*

Don't forget that it is *merit* that has put Cork Insert over. There is no magic in the name or qualities of Cork. It has wonderful frictional properties. But by itself, it is utterly valueless as lining material.

The secret of Cork Insert Service and its success is the Cork Insert Way of combining cork and lining. It's a patented way. No other lining does the work equally well.

So look out for the imitations. They haven't the big combination idea that makes Cork Insert a success. It is easy to get Cork Insert. Most dealers sell it — any garageman will install it. Either can get it in a few hours, for all jobbers sell it.

Advance Automobile Accessories Corp.

Dept. M5-1, 56 East Randolph Street, CHICAGO

$3 per Set of 3

Rockies West, $3.25—Canadian Price, $4.50

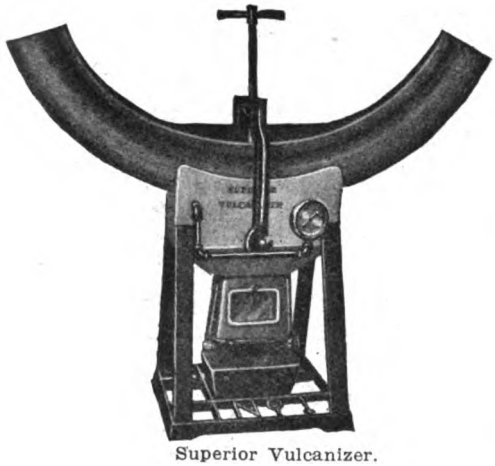
$1
for 1917-18 Fords
85c for 1916 and earlier Fords

Canandian Prices: 1917-18 model, $1.50; earlier models $1.25

Smooth Action, Sure Brake, Long Wear

—that's the service that Cork Insert Transmission Lining gives. When you apply the brake, the corks hit the brake drum first. They compress gradually and ease the load down to the fabric. The light pressure required, and velvety smooth action of the buttons of cork coming in contact with the drums, means such long wear that Cork Inserts are far the cheapest in the long run.

Keeps the Ford Fan Fanning



Retards overheating. Most motor trouble is caused from overheating. This is due in no little degree to loss of driving power—estimated as high as 25% to 50%—because ordinary fan belts slip and stretch. Cork Insert Fan Belts stop the slipping. It doesn't have to be run light to prevent slipping, like ordinary belts. This, plus its durable construction, means extra long wear and economy. Cork Insert Fan Belts outlast all others—hence economical.

CORK INSERT

Superior Vulcanizer.

Anyone who is contemplating the repair of automobile tires should investigate the line of vulcanizers which are being sold by the Superior Vulcanizer Co., 16-A

Superior Vulcanizer.

Fulton Ave., Rochester, New York. Our readers should send for catalogue and price list.

Oxigene.

At the fuel tests inaugurated by the New York Herald and held on Oct. 2nd, 3rd and 4th, at Sheepshead Bay, it was successfully proven that by the addition of a liquid to gasoline, the mileage obtainable from the gasoline could be increased at least 50 per cent and in some cases even more.

The liquid which made this remarkable showing is sold by the Miller Chemicals, Inc., 350 W. 26th St., New York City. Although many extremely satisfactory private tests had been made with Oxigene, its great practical value was demonstrated fully at that time. In addition to the increased mileage obtainable, it was demonstrated that Oxigene prevented the formation of carbon in the cylinders.

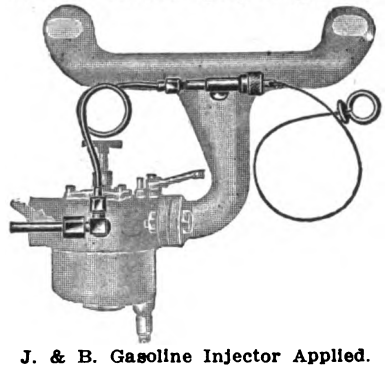
The manufacturers of Oxigene claim that there is no danger of chemical action with this product. When used according to directions the results are remarkable.

Small Tools Catalogue No. 40.

The Greenfield Tap & Die Corporation of Greenfield, Mass., have just issued their catalogue No. 40 of small tools, taps, dies, screw plates and reamers. The booklet is considerable more than a catalogue, and deserves special mention because it contains so much useful information relative to machine work in this particular field.

A great number of pages are devoted to tables and useful information. Every garage owner should have this book for the very reason that it gives so many suggestions as to equipment. The repairman does not realize how cheaply he can purchase tools until he has consulted this catalogue.

Hotel Winton Books Many Cleveland Conventions.



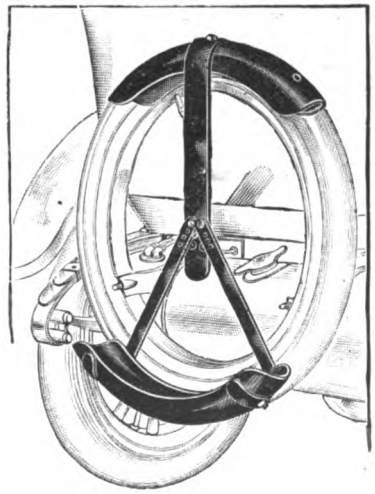
Of the large number of conventions scheduled for Cleveland during the month of November, the Hotel Winton had 75 per cent on its books.

The preference of this hotel by the majority of committees, who chose Cleveland and its advantages, has attracted no little attention throughout the country. It was a popularity due, no doubt, to the facilities offered by the new, beautiful and spacious Hotel Winton.

The comfortable, home-like rooms, the preparations that had been made for the visitors, the exceptional service rendered, the convenient location of the hotel, the arrangements laid out for an expedient conduct of all convention business, and the rainbow room with its ice carnival and bevy of ice stars, were commented upon time and time again by the various committees.

J. & B. Gasoline Injector.

During the winter weather gasoline will not vaporize readily, consequently an owner may figuratively "crank his head off" without getting a single explosion from his cold engine. There is one way to start an engine, however, and that is to prime it; to force a spray of gasoline into



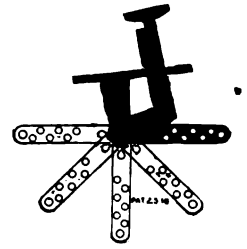
J. & B. Gasoline Injector Applied.

the manifold near the cylinders right where the spray is necessary.

Such a device is manufactured by the J. & B. Manufacturing Co., Pittsfield, Mass., and called the "J. & B. Gasoline Injector." This device is very easily installed. But one hole has to be driven in the manifold and the installation is practically complete. With it, gasoline is pumped from the supply line and injected into the valve ports. A small ring projects through the radiator and serves to operate the injector.

Adjustable Tire Carriers.

The International Stamping Co., 400 N. Leavitt St., Chicago, Ill., market a product which is well worth investigating. These devices are known as "Adjustable



Adjustable Tire Carriers.

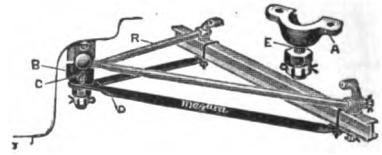
Tire Carriers." They are so designed that practically any number of tires within reason may be supported at the rear of an automobile. The first tire is clamped in the usual method to the back of the car and fastened firmly in place, then one of the adjustable tire carriers is hung upon this first tire.

At the lower edge of this carrier is a steel casing which supports the second tire. The second tire is strapped into place and supported at the top or sides and a third adjustable tire carrier slipped over the second tire. The illustration clearly shows how the device is applied.

Petry Universal Pedal.

The car owner or garageman who is called upon to install a muffler cut-out of any style or size, an accelerator, an exhaust whistle, horn or heater valve should investigate the universal pedal sold by the N. A. Petry Co., Inc., 1313 Race St., Phil-

Petry Universal Pedal.



adelphia, Pa. The feature of this device is its adjustable arm.

The arm can be placed in practically any position so that the pedal can be adapted to the floor board or toe board or even the dashboard of any automobile. The illustration given herewith shows a number of the positions. When locked in any position the lever is adjustable to pull or push any device.

Mazura Auxiliary Radius Rod.

Many Ford drivers have often wondered why their cars could not be steered easily. They may have compared their own cars with some other machines and found that their cars suffered by comparison. In many cases the reason for this trouble can be traced to a bent radius rod.

Once a radius rod is bent, the car becomes very difficult to steer. Should it be broken when the car is in motion, control of the steering may be lost altogether, thus endangering both life and property.

Mazura Auxiliary Radius Rod Applied.

This may happen at any time, and in most peculiar circumstances. Should the car strike a stone or drop into a rut, there is danger of bending the present Ford 'wishbone" as it is often called.

To protect the radius rod, the Mazura Auxiliary Radius Rod has been designed by the Mazura Mfg. Co., 412-14 South Sixth St., St. Louis, Mo. This device is made in three different types. "T" Bar Steel, Angle Bar Steel and Tubular Steel, and is attached to the lower part of the front axle.

In place of the radius rod ball fitting cap, beneath the transmission, a new cap is furnished which carries a heavy stud upon which is fitted the auxiliary radius rod. Since the device is fastened to the lower portion of the axle, it absorbs many of the strains which might otherwise break the regular rod and cause an accident.

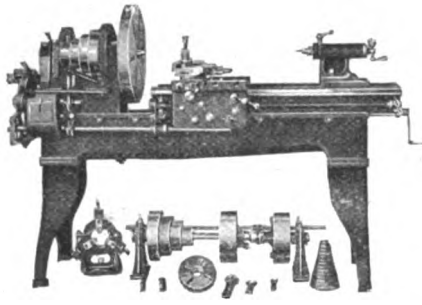
Eccolene.

Present day gasoline, as everyone knows, is practically kerosene. Now, kerosene contains more heat units or more power than gasoline, if we can only use it in the engine. Kerosene is derived from the same base as gasoline, but some of the volatile elements have been removed in the process of distillation.

If we can but replace these elements, we can easily change the kerosene into gasoline, and have a fuel that possesses both power and low vaporizing point. In marketing Eccolene, the distributors, Edward A. Cassidy Co., 280 Madison Ave., New York City, claim to have solved the problem. They claim that Eccolene adds to the explosive force of present-day gasoline.



A Can of Eccolene.

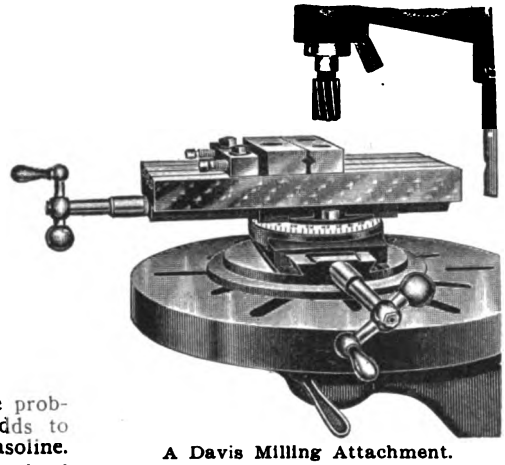
They claim that when Eccolene is mixed with present-day gasoline, the resulting vapor is more thoroughly combustible in the cylinders, therefore it follows that less carbon will be formed. To a certain extent Eccolene may be said to be a carbon remover. With a clean engine more mileage is obtainable and the engine output of power is increased considerably. Our readers are requested to try this product.

Extension Gap Lathe.

Unquestionably the most important machine in any repair shop or garage is a lathe. A repairman cannot do good work unless the lathe is of the best.

Our readers who intend to operate a shop of any size should investigate the line of lathes manufactured by the Barnes Drill Co., 814-830 Chestnut St., Rockford, Ill. Their extension gap lathe is a particularly good proposition.

Extension Gap Lathe.



For the benefit of our readers who do not understand this device, we will say that such a lathe has a sliding bed which may be pulled back to admit a large diameter piece of work.

Our illustration shows the movable bed and a large face-plate on the machine. When turning small work the bed is pushed against the head. The lathes manufactured by this concern are of the best quality materials. No expense is spared in fitting them and the design is modern. The Barnes Drill Co. also manufacture different types of milling and taper attachments as well as lathe tools. Any one interested should write for literature.

Davis Milling Attachment.

The garage owner or repairman who owns a drill press should investigate the Davis milling attachment sold by the Hinckley Machine Co., Hinckley, Ill., and illustrated herewith.

This device can be used for cutting key seats straight or taper, for milling deep grooves or slots, for re-facing small pieces and for cutting Woodruff or half-moon key seats. The device is fitted with a circular base 12½ inches in diameter. It has a cross slide movement of 7 inches, a longitudinal movement of 12 inches. The vise jaws open 10 inches.

A Davis Milling Attachment.

The attachment is strong and well made. The bearings are scraped and the screws run in bronze nuts. The revolving table is divided into degrees. Our readers are requested to write for catalogue and descriptive matter.

Little Giant Starter.

Very frequently we receive requests from our readers for details concerning Ford starting systems. A mechanical starter has just been placed on the market by the Little Giant Starter Co., of Canton, Ohio, which should be of interest to our readers.

The Little Giant as it is termed, consists of an ingenious combination of ratchets, a chain and a long pedal. It is so arranged that one pressure of the foot upon the lever turns the engine over half a turn, but the action is extremely rapid, and has the effect of spinning the engine. Should the engine backfire, the starter releases automatically.

Everyone knows that it is much easier to operate a lever with the foot than it is possible to crank an engine. With the starting outfit is furnished a primer to facilitate starting. Any ordinary mechanic can attach it in a short time, and the old hand crank is left on the car for use in an emergency.

The Hele-Shaw Clutch.

An old repairman was once heard to say that though he had done a great deal of repair work on clutches, he hardly knew what the inside of a Hele-Shaw clutch looked like, simply because they were always in condition and usually lasted longer than the car did.

The Hele-Shaw clutch, sold by the Merchant & Evans Co., 2019-2035 Washington Ave., Philadelphia, Pa., is made of phosphor bronze and cold rolled steel. The discs present great frictional area for their size for they are fi ed with "V" grooves which increase the frictional area. The outer plates of phosphor bronze are driven by the engine and fit into grooves in the inner surface of the housing. The inner plates of steel drive the clutch shaft.

The whole assembly is enclosed in an oil-tight housing which carries the lubricant. It is claimed that this clutch is extremely flexible; that it does not slip, and that its action is smooth in starting. The clutch assembly may be applied to practically any type of power machinery, as well as automobiles.

A Hele-Shaw Clutch.

Our readers who are interested in this device should write to the manufacturers for their descriptive booklet. This company also manufactures a line of universal joints.

Universal Battery Clips.

The storage battery man realizes that considerable time is taken by removing battery terminals and connecting the wires with the battery. Time is money, no matter in what industry time is consumed.

A Universal Battery Clip.

To solve this little battery problem, R. S. Mueller & Co., 435 High Ave., Cleveland, Ohio, have manufactured a universal battery clip. This clip has a spread of jaws of 1½ inch, is made of extra heavy stock, and lead plated to resist corrosion.

The clip should be clamped or soldered to the connecting cords from the charging board and when a battery is to be charged the clip is snapped upon the terminals. The jaws of the clip are pointed so that it will not slip from the terminals. A heavy spring is incorporated which holds the jaws firmly against the connection.

The Mayhew Curtain.

The Sutter-Mayhew Co. of 174 Canfield Ave., West, Detroit, Mich., are marketing an adjustable curtain to be used in front of the radiators of popular cars. The old method of placing a piece of pasteboard in front of the radiator during the winter to cut off the air, is at best a makeshift, and a car that has a piece of pasteboard in front of the radiator presents an appearance somewhat similar to a window which has been repaired by stuffing newspaper in it.

The Mayhew adjustable curtain consists of a specially designed roller fitted to the lower part of the radiator. Upon this roller is wound the curtain and connecting

NEW BOOKS RECEIVED.

The A B C of Aviation: The author of this book, Capt. Victor W. Pagé, is well known. He has for a number of months been the Chief Engineer Officer of the Signal Corps Aviation School, Hazelhurst Field, Mineola, L. I., and is fully competent to write upon subjects pertaining to aviation. Our readers will recall that Capt. Pagé has written a number of automobile books, and is a competent automobile engineer. His book upon aviation is complete and gives the detailed construction of practically all the machines in use. Every student of aviation surely should investigate this book which is published by the Norman W. Henley Co., 2 West 45th Street, New York City. The price of this book is $2.50.

The Sister of a Certain Soldier: We are in receipt of this book written by Stephen J. Maher which deals with one phase of the war situation. The story has an appealing interest, and is cleverly told. This book sells for 25 cents and is published by the Tuttle, Morehouse & Taylor Co., of New Haven, Conn.

The Successful Salesman: Our readers will remember the interesting series of advertising articles which have appeared from time to time in this magazine, written by Frank Farrington. We expect to publish more of these articles. Mr. Farrington is now in Y. M. C. A. work, and has recently written a book entitled "The Successful Salesman." This book is written in Mr. Farrington's bright style, and only those who have had the pleasure of reading his series can realize how many practical suggestions relative to advertising and salesmanship Mr. Farrington can give. The book is published by Laird & Lee, Inc., 1732 Michigan Avenue, Chicago, Ill., and sells for $1.

Practical Hints on Vulcanizing: The Auto Tire Equipment Co., of 326 East 8th Street, Cincinnati, Ohio, recently forwarded us their illustrated booklet relative to vulcanizing tires. This booklet contains many good suggestions relative to this branch of the work, and should be had by everyone who does this kind of work.

(Editor's Note.—The publishers of the Automobile Dealer and Repairer will furnish at the published price any of the books which are mentioned from time to time in this magazine.)

If you like this magazine and feel that it is useful and interesting, the *one best way* to show your appreciation, is to purchase your accessories and supplies so far as possible from our advertisers. Also write to our advertisers for catalogs, printed matter and prices, not forgetting to always mention the fact that you saw the advertisement in the Automobile Dealer and Repairer.

"YANKEE" Ratchet
Multiplies Man's Power

These "YANKEE" Ratchet Screw-drivers actually take the place of your muscles and effort in the alternating "grip and let go" action necessary to drive a screw.

You grasp the handle—once. Turn to and fro and the "YANKEE" Ratchet does the rest. It grips on the forward turn and releases on the back turn better than your hand can possibly do it with a common screw-driver.

To *draw* the screw, reverse the Ratchet adjustment with your finger tip. The Ratchet then moves backward, and out comes the screw.

With the "YANKEE" you keep a continuous pressure on the blade in the slot and a steady grasp on the handle. No excuse for "losing the slot."

"YANKEE" Ratchet Screw-drivers give you three adjustments: Right-hand for driving, Left-hand for drawing, or Rigid. All done with your finger tip. Real savers of time and tire. Polished steel blades, nickeled bodies, polished hardwood handles.

"YANKEE"
Ratchet Screw-drivers

	No. 10	No. 15
2 in. Blade	50c	55c
3 in, "	60c	60c
4 in. "	70c	65c
5 in. "	80c	70c
6 in. "	90c	75c
8 in. "	$1.00	80c
10 in. "	$1.20	
12 in. "	$1.30	

No. 15 has the handy Knurled Washer for starting wobbly screws with thumb and forefinger, while hand steadies the driver. Diameter of blade, 3-16 inch.

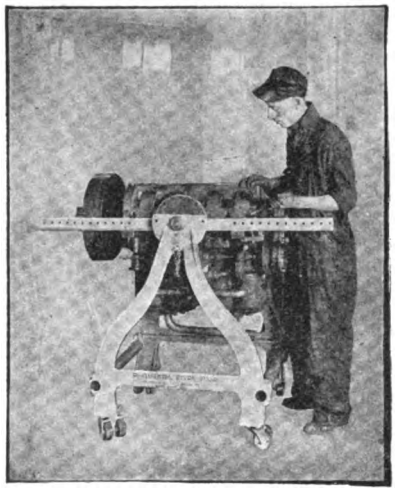
Digitized by Google



with the curtain is a length of cord. The cord passes through a joint at the top of the radiator and back to the dashboard.

Without leaving his seat, the driver can pull the curtain partially over the front of the radiator or entirely over it. In this way he can control the temperature of the engine at all times. The device in no way detracts from the appearance of the car, in fact it may be said to add to it.

Continental Motor Stand.

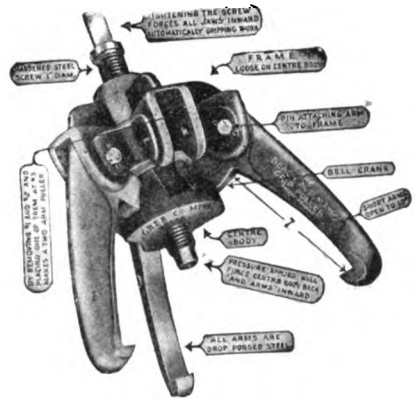
In this issue one of our contributors speaks of garage and repair shop equipment, and mentions, in particular, a portable engine stand. Undoubtedly such a device is of infinite value to the repairman.

The Continental Auto Parts Co., Knightstown, Ind., manufacture a stand which is adaptable to all types of engines. This stand consists of two heavy "A"

Continental Motor Stand.

frames which are adjustable toward or away from each other. Supported to the top of these frames by pivots is a small stand which in turn is fitted with a cross member for the three-point suspension type of engine. This cross member is removable and the frame is so arranged that any width or size of engine can be mounted upon it.

With but little effort the engine can be tipped to any angle for repairs or turned upside down if necessary for repairs to the crankshaft main bearings or connecting rods. Heavy castors are fitted to the bottom of the stand so that the engine may be wheeled to any part of the shop for machine repairs. The stand is flexible and adaptable to many kinds of work.



New Sales Manager.

Mr. Homer Hilton, for some time an advertising man upon the staff of the Class Journal Co., and the Automobile Trade Directory, and later with the western office of the Cosmopolitan Magazine, recently accepted the position of sales manager with the Oshkosh Motor Truck Co.

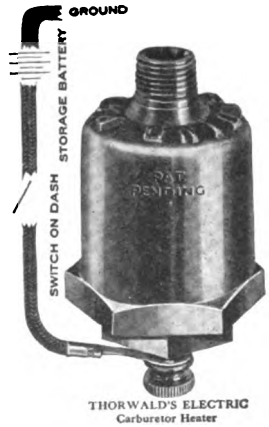
Beach Automatic Grip Puller.

The old sledge hammer method of removing fly wheels, gears and pulleys has long since passed into the discard. The modern garageman knows that an automobile can be ruined by the careless use of a hammer, and therefore he equips his shop with some sort of a wheel and gear puller.

The Greb Co., 172 State St., Boston, Mass., call the attention of the trade to the Beach Automatic grip puller, an ex-

Beach Automatic Grip Puller.

ceptionally efficient and durable tool. The device is different from all others on the market, in that the more pressure exerted by the tool, the tighter the jaws will cling.



The center body of the device is slotted at four points, while the large seven-inch jaws have projecting fins, termed bell-cranks, which fit into the slots. When pressure is applied to the steel screw at the center, the center body slides in the frame and automatically grips the jaws tighter against the work. The arms are made of drop forged steel and held in place by pins and cotter pins. It can be used with either two or three jaws and can be adapted to practically any kind of work.

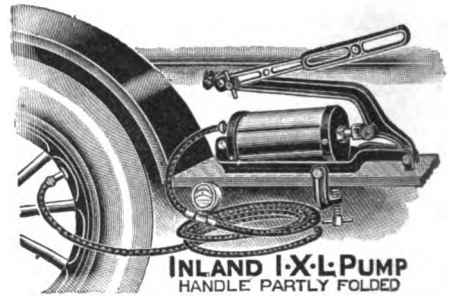
The center body is so arranged that it may be locked into position by a special lever. In addition to the small seven-inch arms, three long arms are furnished which measure twelve inches from the bell crank or projecting fins to the hooks at the ends.

A special puller designed upon the same lines can be had in a smaller size for magneto or other small work. Every garageman should investigate this valuable tool.

Thorwald Electric Heater.

In every mail we receive letters from our subscribers telling of the difficulty

Thorwald Electric Heater.



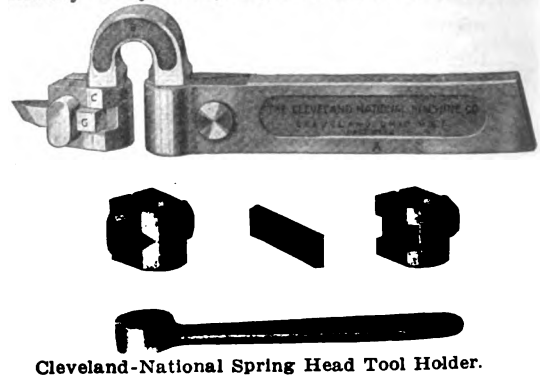
they encounter in starting their engines. We usually reply by telling them that some sort of a heater, or primer, is necessary. It is the only answer to the question. Gasoline must be vaporized before the engine can be started and heat is the one thing that is necessary.

To furnish this heat at the right point has been the problem of many manufacturers, and the Thorwald Mfg. & Sales Co., 1307 Jackson St., Omaha, Neb., market a little device which would seem to be the solution of the problem. This device is known as the Thorwald electric carburetor heater. It is a little electric unit which is designed to be attached through a switch on the dash to a storage battery.

When the switch is turned on, current passes through the heater, and the resistance to the current develops heat. The device can be attached to the carburetor or intake manifold and serves as a small hot spot which will vaporize the gasoline.

Inland I-X-L Pump.

Motorists who are interested in tire pumps should investigate the Inland I-X-L pump, manufactured by the Inland Pump Mfg. Co., 609-12 Reaper Block, Chicago, Ill. This pump is said to develop a lever-



Inland I-X-L Pump.

age 18 times greater than the ordinary foot pump, and can be operated very easily. The cylinder is made of seamless drawn steel tubing. It is furnished complete with hose and gauge if desired.

Spring Head Tool Holder.

Illustrated herewith is a special tool holder manufactured by the Cleveland-National Machine Co. of Cleveland, Ohio. This tool holder is designed especially for finishing work. The spring head is said to relieve chatter and give a perfectly smooth cut.

One feature of the head is its adaptability to any angle of work. It is mounted

Cleveland-National Spring Head Tool Holder.

upon pivots and can be swung to any angle up to 90°.

Tool clamps are furnished in a number of sizes and are interchangeable. They are arranged so that they can be inverted and the tool used at either side of the holder. Parting tools as thin as .014 can be used with success. At the present time the above company are making a 30-day trial order. Our repair shop readers should write for illustrated literature and special offer.

F.W.S. ROLLER BEARINGS

for FORD and CHEVROLET FRONT WHEELS

F. W. S. IMPROVED RETAINER

(Patent applied for)

(1) **BROADWINGS OF CAGE** provide broad and smooth surface against rollers, so rollers cannot get out of line

(2) **STRONG CAGE** is secured by double walls of high carbon steel, outer edge reinforced by turned edge, giving three thicknesses at that point.

(3) **DIRT PROOF:** Large diameter rollers and open cage prevent accumulation of dirt and avoid friction

(4) **MINIMUM FRICTION:** Large roilers minimize friction and wear, practically eliminating breakage.

(5) **LUBRICATION:** The wings provide pockets to retain the grease, but accumulated dirt cannot pack in around the rollers

(6) **CONES AND RINGS** made of especially prepared steel properly tempered and ground to absolute accuracy in size and contour

Satisfaction guaranteed.

F. W. STEWART

1404 Michigan Ave., CHICAGO

DEALERS AND GARAGEMEN:
Write for Further Particulars.

Improved Repair Shop Efficiency.

The imminent need of a light portable power-driven device to replace the screwdriver or brace for valve grinding in the repair departments of progressive garages has come to be indispensable owing to the increase in valves in the motor construction of today and the shortage of labor.

Manufacturers have been quick to realize the great field for such a device and as a result several devices have made their appearance on the market within a comparatively short time.

In solving this problem for the repairman, the manufacturer has had to confine himself to the peculiar sensitive nature of the work. A tool that would be severe on the most vital part of the motor would be useless.

To begin with, a rotary motion is out of the question, as it would score the valves on high speed, so the universal conclusion seemed to be a duplication of the same motion now used in hand valve grinding, namely, an oscillating motion with a considerably reduced stroke. Excessive weight was another point to be overcome as the tool should not be tiresome to hold in the operator's hand at the same time a minimum pressure on the valve is desirable although a spring used under the valve head relieves considerable direct weight.

It also became necessary to develop the gentlest oscillating motion possible in order to reduce vibration, thus insuring a longer endurance for the tool, at the same time avoiding chatter at the point of grinding.

Of course it was inevitable that the wonderful resourcefulness and ingenuity of our American manufacturers would soon develop a successful portable electric valve grinder that saves at least two-thirds of the time now necessary to do the same work by hand besides doing it easier and really better. Who will deny the more uniform results obtained by the elimination as far as possible of the human element?

A new and notable achievement in this line has been the accomplishments of the Petterson Engineering & Mfg. Co., of Worcester, Mass., who made a deep study of valve grinding requirements. They feature a combination electric drill and valve grinder. This device is capable of drilling holes up to one-quarter inch in diameter, also grinds valves, neither operation interfering with the other in the slightest degree—the extraordinary simplicity of this device is the chief claim made by the Petterson Engineering & Mfg. Co., as evidence of its durability.

Substantially housed, pack hardened steel gears, forced and keyed to shafts throughout, ideal lubrication system and split casing, affording accessibility to the interior whenever necessary are also noteworthy.

Mr. Charles L. Jernberg, formerly connected with the B. F. S. Manufacturing Company, originally suggested as possible the combination electric drill and valve grinder and an improved valve grinder to Mr. Petterson and Mr. Werme, well-known engineers, with the result that within five months these gentlemen developed the suggestion and are now associated together with Mr. J. H. Lindberg in the manufacture of combination electric drill and valve grinders, electric valve grinders and drills under the trade name "Bilt-Rite," with office and engineering address, 311 Main St.; factory, 54 Hermon St., Worcester, Mass.

Heintz Vulcanizer.

Undoubtedly the next few years will see an unprecedented increase in tire repairing, brought about by the increase in the cost of crude rubber. Therefore there will be a great number of tire repairing shops springing up throughout the country. Necessarily there will be a call for vulcanizing apparatus.

Everyone who is intending to go into this business should investigate the product of Jas. C. Heintz & Co., 2069 E. 9th St., Cleveland, Ohio. This machine is designed for connection with a 110 volt lighting current. The electric current furnishes the heat to vaporize the water. In the smaller size of machine, one pint of water is used, while one quart of water is used in the larger size.

Heintz Vulcanizer.

The capacity of the small size is practically 18 tubes per hour, while the capacity of the larger size is practically 24 tubes per hour. Such is the design of the machine that the steam pressure is controlled at all times by a patented automatic pressure control.

REPAIR GEARS, Axles, Wheels, Motor Parts, Bodies, Springs, Magnetos, Tops, Coils, etc., for all cars. Vim, Hudson, Mitchell, Buick, Overland, Stoddard, Dayton, Haynes, Studebaker, Marion, etc., etc. We can furnish anything at short notice. Address Atlantic Supply Co., Long Branch, N. J.

Instruction

AUTOMOBILE INSTRUCTION—The West Side Y. M. C. A. Automobile School gives a practical course in shop and road practice in four or eight weeks, day or evening. Provision made for out of town men. 322 West 57th St., New York City.

Cylinders Reground

Old Engines Made New

BY Having Us

REGRIND THE CYLINDERS FIT NEW PISTONS, RINGS and PINS

Twenty-one Years of Engineering in Our Work

Butler Manufacturing Co.
1131 E. Georgia St. INDIANAPOLIS

CYLINDER GRINDING on automatic machinery by skilled mechanics at prices that will interest you. Gears, axles, valves and parts of all kinds made of high grade alloy steel. Send us your worn or broken parts and we will replace them. Oxy-Acetylene Welding. Cracked cylinders a specialty. Adapt Machinery Co., 1632 So. Wabash Ave., Chicago, Ill.

Auto Accessories

IGNITION, STARTING-LIGHTING
Genuine Parts only used in repairs.

K-W Magnetos -:- Zenth Carburetors

CLEVELAND IGNITION CO.
1845-47 Euclid Ave., CLEVELAND, OHIO

NOTICE, REPAIRMEN!—If you repair Ford cars you need our line of cylinder reamers, motor stands, quick-raising jacks, portable hoists, straightening presses, speed tools and wrenches. Geneva Machine Works, Geneva, Indiana.

If it's for a "Ford" car we have it. Write for catalogue and price list. If it's for a "Ford" car we have it. Universal Motor Supply Co., White Plains, N. Y.

VULCANIZING USED AUTO TIRES is a growing and profitable business, especially now. Easy to learn. Instruction book $1. Plants, $50 and up. Catalog free. Equipment Co., 304 8th St., Cincinnati, O.

Radiators and Lamps

WE REPAIR Lamps, Radiators, Windshields and Fenders, of every description. Largest repair plant in New York. Great accessory bargains on hand for immediate delivery.

HUDSON AUTO LAMP WORKS
141 West 54th Street, New York City

Rectifiers

RECTIFIERS to charge from A-C circuit 1 to 8 ignition lighting or starting batteries at one time, $12.00 upward. American Battery Co., 1136 Fulton St., Chicago, Ill.

Piston Rings

Don't forget we are now in our new factory at

Harris Avenue *and* Marion Street

Where we are in a position to render you more prompt and efficient service than in the past.

Houpert Machine Company
Harris Ave. & Marion St.,
Long Island City, N. Y.

A Different Carbon Remover.

Carbon-X, the "Guaranteed Carbon Consumer," is something new and "different" in the field of carbon removers. According to the manufacturers, Carbon-X is not a carbon "remover"—it is a carbon "consumer."

Since the carbon deposits in the firing chambers of a gasoline motor represent unconsumed fuel which has not delivered its quota of power to the crank-shaft, it follows that a carbon "consumer" that actually consumes the deposited carbon, as fuel, and delivers its equivalent, in power, to the crank-shaft, is an important factor in maintaining efficient motor performance, as well as tending toward economical gasoline consumption.

It is said that Carbon-X does all this. Carbon is consumed in this manner without laying up the car, and without the aid of an expert mechanic. Carbon-X is made only in tablet form, and is packed 30 tablets in a screw-top carton. It is sold by dealers under this unqualified guarantee: "Every package contains satisfaction—money refunded if you don't find it." "C-P" Chemical Company, 305-326 River St., Chicago, Ill.

Rose Tire Pump.

J. H. Haney & Co. of Hastings, Nebraska, are marketing a tire pump which has attracted considerable attention. This pump is of the single plunger type, and has a heavy steel barrel polished inside. A peculiar feature of this pump is that of the air inlet valve in the plunger. Instead of using the cupped leather on the plunger as an air valve itself, the plunger rod is fitted with an air valve. With the pump is furnished a heavy five-ply hose.

Send for free sample of The Automobile Dealer and Repairer.

The Alliance Controller.

The tire repairman who uses steam vulcanizers in which the steam is generated by gas, should be interested in a device which is being sold by the Alliance Controller Co., of Alliance, Ohio. Heretofore there has been danger of excessive steam pressures when gas has been used as a fuel. Should anything go wrong with the safety valve, or the gas burners, with the

The Alliance Controller.

excessive pressure, over-curing of the tire would result; consequently money would be lost.

The Alliance controller, however, takes care of and eliminates these dangers. It is designed for all types of gas-burning vulcanizing machines and can be attached in a few moments. It attaches to the gas line and connects with the steam chamber. When the pressure in the volcanizer reaches a pre-determined point, the gas is automatically shut off. The controller regulates the flame and holds the steam pressure at the desired point.

In starting the vulcanizer the controller permits a full flow of gas to the burner. The controller valve can be set at any time and requires no further attention, simply light the gas and the pressure will remain constant after steam has once been generated. One can see that the saving of gas had by this machine will soon pay for it.

U. S. Government Approval.

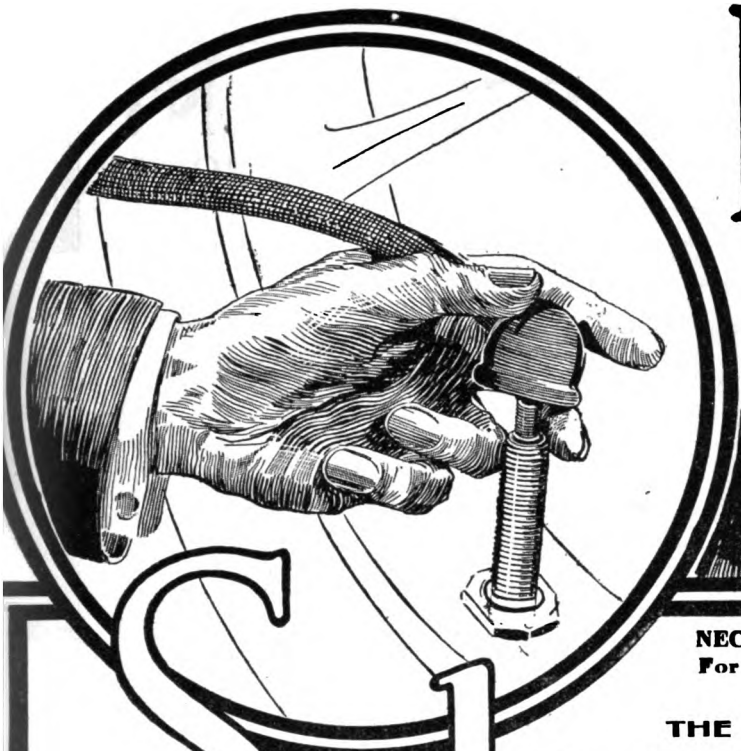
The British government at the beginning of the war tested out the truck built by the Four Wheel Drive Auto Co., Clintonville, Wis., and approved it for the heaviest duty performed at the front.

The United States government tested out the F. W. D. truck in the Mexican border campaign, and adopted it for use over the rough desert roads and trails of Texas and Mexico.

When the United States entered the world war the War Department adopted the F. W. D. as the standard truck for heavy ordnance transport, and orders were placed for many thousands of these machines for duty in France. They were built by the Four Wheel Drive Auto Co. of Clintonville, Wis., and their licensees—Premier Motor Corp., Indianapolis, Ind.; Mitchell Motors Co., Racine Wis.; Kissel Motor Co., Hartford, Wis.

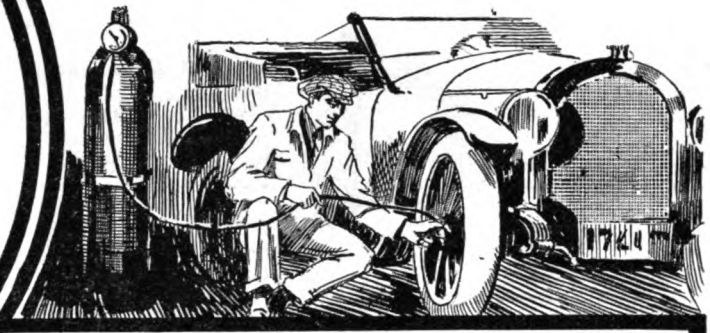
The Evans Model "Hele-Shaw" Clutch and Evans Alignment Joint exclusively used in the F. W. D. equipment is manufactured exclusively by Merchants and Evans Company.

The United States Standardization Board, after exhaustive experiments and rigid tests, finally "standardized" U. S. government three-ton artillery tractors, which are of the four-wheel drive type, Model "T.T." and which specify exclusively the "Evans" Model "Hele-Shaw" Clutch. The concerns authorized to produce these tractors are the Militor Corporation of Jersey City and the Packard Motor Car Company of Detroit, who promptly contracted with the Merchants and Evans Co. for their clutch requirements.



"Armored" Gasoline Locomotives are produced and furnished to the government in large quantities by the Baldwin Locomotive Works of Philadelphia and the George D. Whitcomb Company of Rochelle, Ill. All of these locomotives are equipped *exclusively with "Evans" Model "Hele-Shaw" Clutches.*

The U. S. Department of Agriculture, Bureau of Entomology and the Massachusetts State Board in their control work against moths are using Motor Spraying Apparatus (the only apparatus of its kind in the world). *The "Evans" Model "Hele-Shaw" Clutches and Evans Alignment Joints are exclusively used in these machines,* which are made by the Fitzhenry-Guptill Co. of East Cambridge, Mass.



The unquestionable evidences of efficiency above presented should induce you to promptly call upon any of their offices for estimates of your clutch and joint requirements, with a statement of the work in which your trucks are at present engaged. Their illustrated clutch catalog is free for the asking.

"Evans" Universal Joints continue to be largely used for general motor car work. The "M. & E." Ratchet Top Grease Cups are produced and furnished in enormous quantities to a host of truck makers.

It's New!

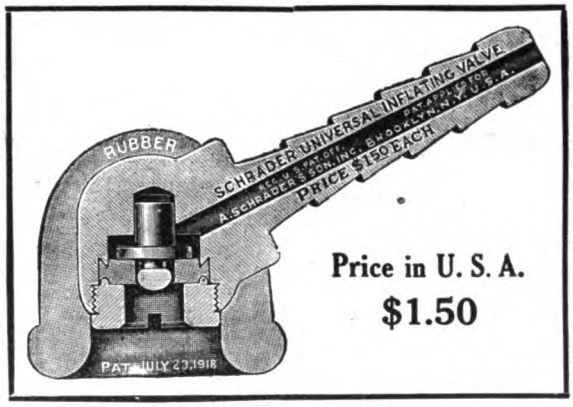
NECESSITY IS THE MOTHER OF INVENTION.
For a new disease there must be discovered a new remedy.

THE

Schrader

AUTOMATIC INFLATING VALVE

prevents EXOSMOSIS of the air-tank.



If you look it up you will find that EXOSMOSIS means the passage of gases through membranes or porous media from within outward.

The SCHRADER AUTOMATIC INFLATING VALVE prevents the passage of your costly compressed air from within your siphon or tank outward into space.

The customer for whom you have installed a "free air" station does not mean to do it, but he does forget to turn off the flow of air after he has inflated his tires at your "pump." The result is that some of your "free air" goes into tires but most of it escapes and is wasted.

We now offer you the means of preventing this waste. With a Schrader Automatic Inflating Valve at the end of your air hose the air supply is *automatically* shut off the minute you remove the appliance from the tire-valve.

It is protected by a thick covering of rubber so that it won't dent or scratch the enamel of the car.

Price in U. S. A.

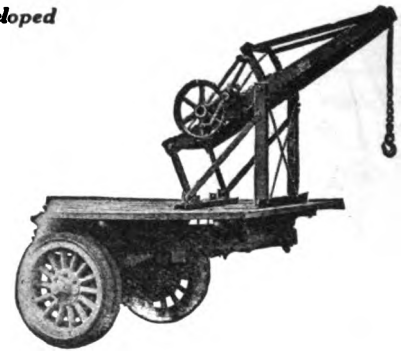
MANLEY GARAGE EQUIPMENT

THE KEYNOTE TO EFFICIENCY AND INCREASED PROFITS

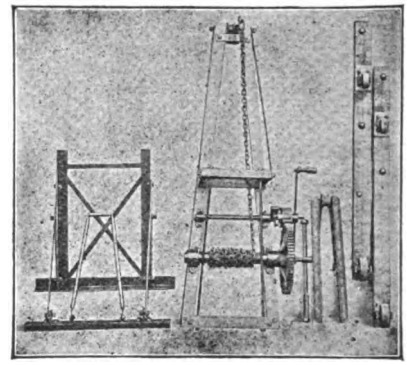
Manley General Utility Garage Crane

The Most Universal Garage Tool Ever Developed



As a Portable Floor Crane for inside or outside uses
Capacity 1½ tons Price, $132.00

A half dozen different tools combined into one.



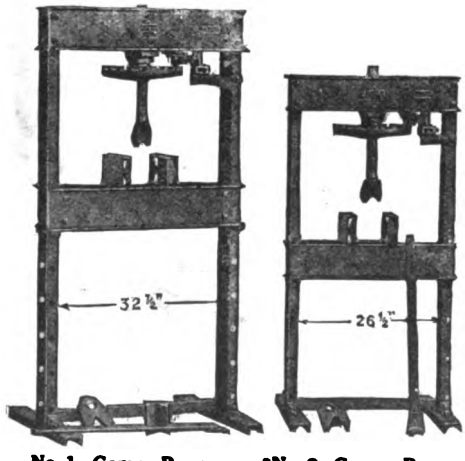
May be used for a hundred different purposes inside the Garage and outside in the country. May be mounted on a truck, chassis of service wagon for use as a general wrecking Crane.

Goes on and off a truck so easily and quickly it is not necessary to keep it tied up for this purpose only. If no truck is available, it may be taken apart and into the country to a wreck on a touring car.

It is taken down and put together again by two men in five minutes. Takes up no room when not in use.

As a Wrecking Crane Mounted on a Truck
Capacity 2 Tons Price, $112.00

May be used inside the Garage for every lifting operation and outside the Garage for wrecking purposes of all kinds. It therefore does double duty.



Any Garage using this Crane will get all the wrecking jobs. It will handle them as no other appliance can, five to ten times quicker. It is specialized for this work.

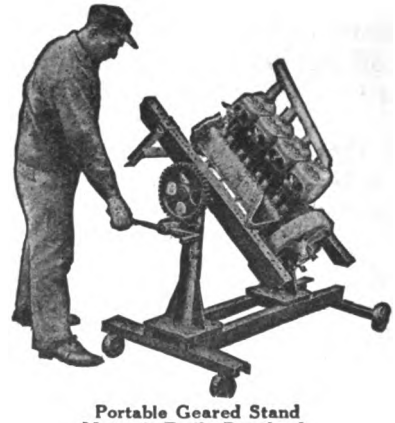
The biggest money making tool for the Garage on the market. Every operation performed by this Crane is one for which the Garage receives big money.

This Crane is constructed throughout of steel except the gearing which is cast iron and the base is seasoned white oak. It has four different leverages to suit all classes of work. The beam may also be tilted to any position from the horizontal to the vertical.

Lift as a floor crane 7 feet, overhang 36 inches, weight 485 lbs. Price, $132.00. Overhang as a wrecking crane 42 inches, weight 375 lbs. Price, $112.00.

MANLEY 22 TON PRESSES

No. 1 Garage Press Price, $98.00 *No. 2 Garage Press Price, $82.00



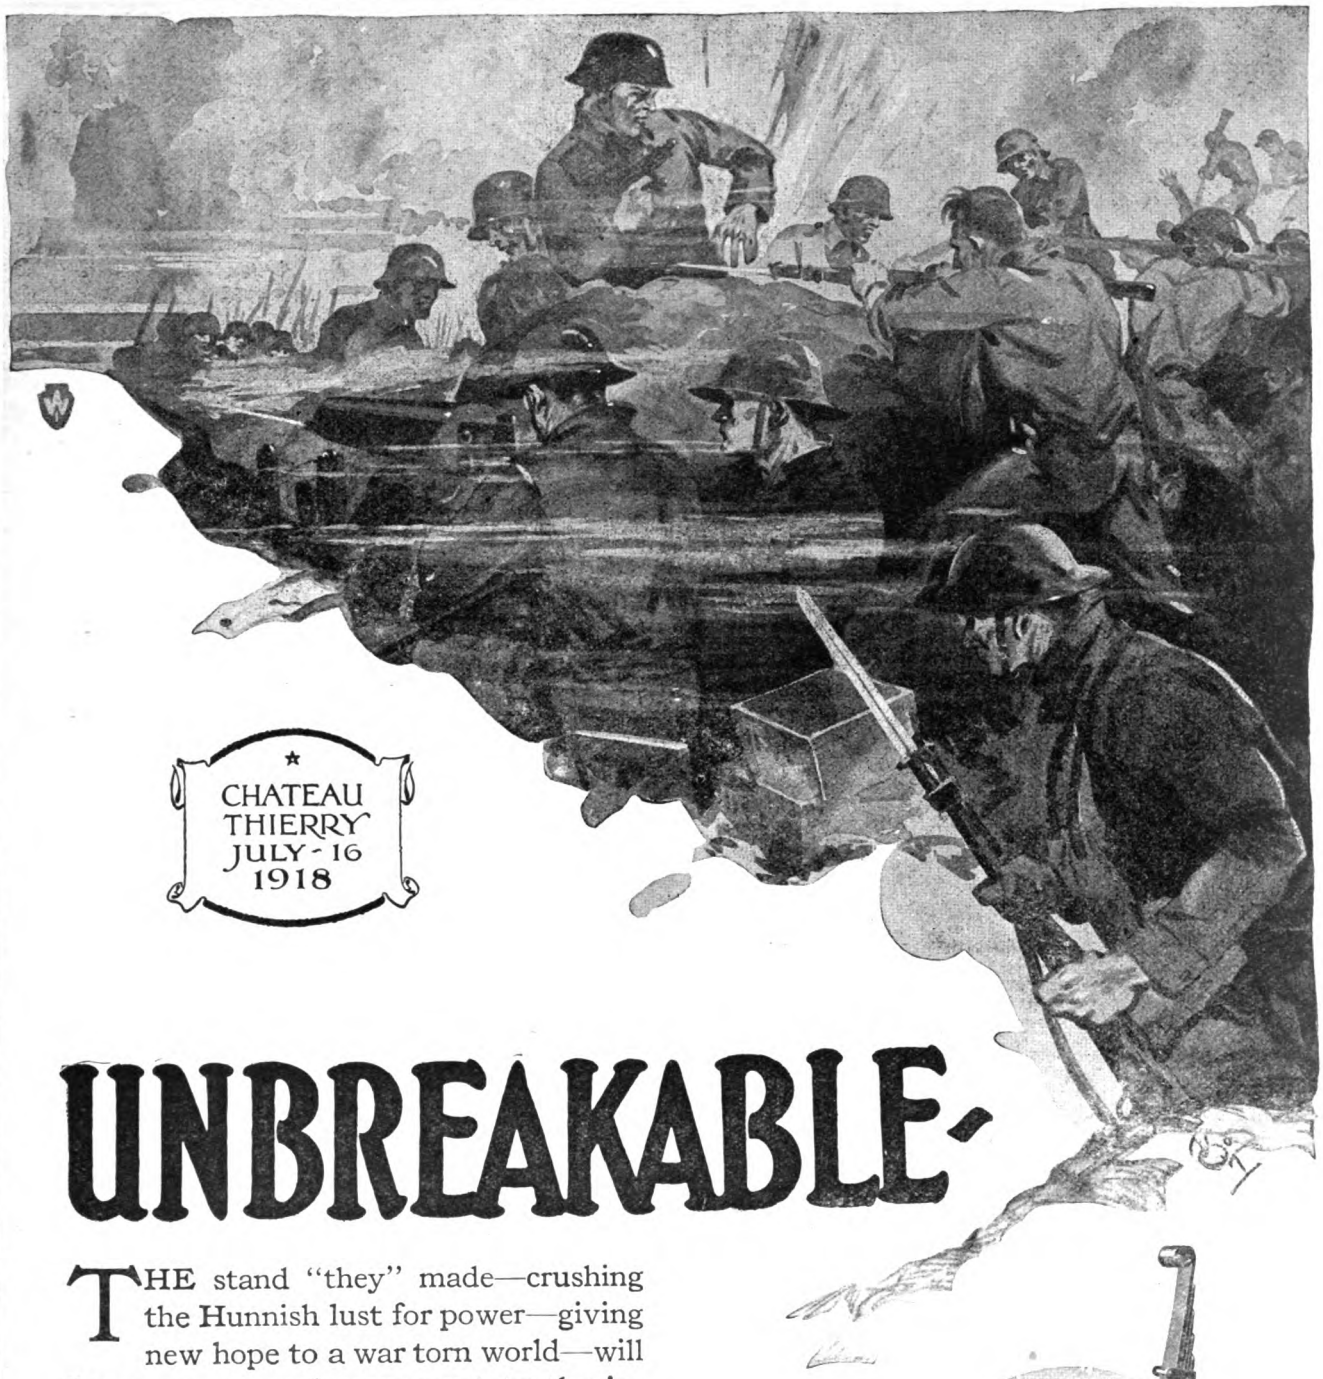
The Manley Line of Garage Presses consists of 4 different sizes making it possible for the Garageman to select a Press to exactly suit his class of work to the best advantage. These Presses have been highly developed and specialized for auto work and possess several exclusive features vitally necessary to handle this work to the best advantage in the shortest time and with the least effort. The two speed, quick change leverage is a tremendous advantage, the screw striking feature for extreme cases, the quick adjusting tables, the possibility to open the side bars to straighten chassis frames, the self-adjusting V Plate, etc., are also instantly appreciated by any Garage operator as real necessities.

MANLEY UNIVERSAL ENGINE STANDS

Plain Geared Stationary Portable

Large and Small

Ford Special Stand



Portable Geared Stand
Motor is Easily Revolved

In Repairing Engines it is only reasonable that every facility should be given to the workman so that he can work to the best advantage by having the motor properly supported so that he can turn it to any position in order to work on the various parts with the greatest ease in a perfectly natural position without cramping, without stooping and without danger. This is what the Manley Engine Stands were designed to do and is what they do with the highest degree of efficiency.

PRACTICALLY UNBREAKABLE

Digitized by Google

Single Suspension

One chain of the hoist may be carried over the pulley in the center of the frame for performing work which can be handled to better advantage by a single suspension. Note that the side braces on the Weaver Hoist are sufficiently narrow at bench height to enable the Hoist to be run up close to the bench and an engine or similar burden deposited upon it.

WEAVER AUTO HOIST

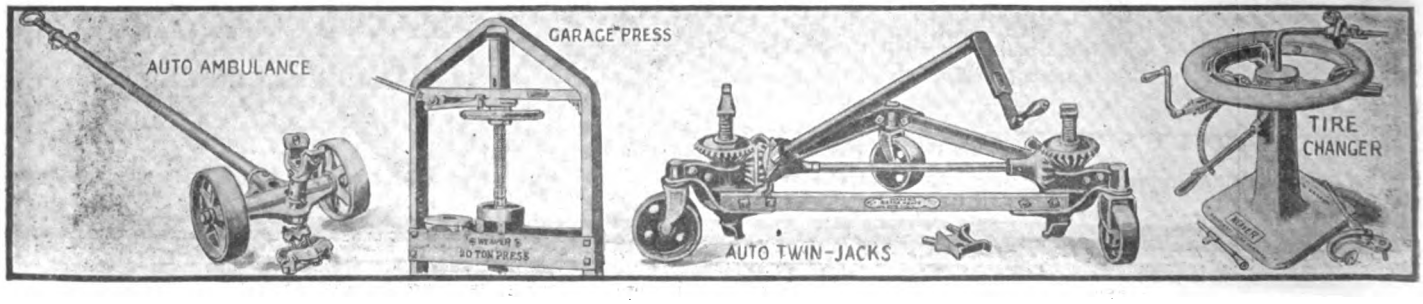
The WEAVER Auto Hoist is a combination block and tackle, crane, traveling hoist and derrick, with either single or double suspension, all in one. It is possible to place the hoist in position for any kind of repair work necessary on the motor car.

For Example:—Taking Out Rear Systems. Removing Car Bodies. Taking Out Front Axles. Removing Engines, Cylinder Blocks, Etc. Handling Transmissions or other heavy parts.

GARAGEMEN will instantly appreciate the saving this means in equipment, in time and in labor. It does away entirely with the dangerous and room-consuming pit. It eliminates the necessity for a crane. In the crowded shop it is especially adaptable because when not in use it can be run out of the way over a car, occupying practically no floor space at all. And in any shop it will quickly pay for itself time and time again.

The lifting mechanism of the WEAVER Auto Hoist provides a leverage of approximately 500 to 1, and allows for the lifting of the heaviest cars with very little effort.

The chains are tested to withstand a strain far in excess of any condition that may be met in actual service.



The frame is of 5-inch channel steel of great strength, and is telescopically constructed so that the arch may be raised twelve inches over normal heighth, thus permitting the raising of a high limousine for removing the rear system (see illustration in small circle on the right hand side of upper illustration.)

The hoisting mechanism is operated by worm drive which is absolutely safe and positive. There are no gears or ratchets to slip or break and so allow the load to fall.

Write For Complete Details

Let us send you, FREE, our catalog fully describing this and other WEAVER Shop Equipment. For years we have specialized on shop equipment, and unless you have studied our line of products you will never know *how efficiently your shop can be equipped.*

HARNESSING the power of America for the vigorous prosecution of a Victorious War against the foes of Democracy has developed the greatest single force the world has ever known.

As small a part as the 100 per cent war production of our plants played in the vast program, it was one of the vital cogs in that Great Machine that has redeemed civilization.

American Hammered Piston Rings were chosen by Uncle Sam and our Allies for war motors. It was recognized that the exclusive American process of *Hammering in the quality* gave to the motor every atom of power that gasoline could generate, and assured the greatest possible degree of motor efficiency. Curtailed as our production for trade consumption has been, arrangements are rapidly being perfected to supply the demands of the manufacturer and the trade.

With an Ewald Tire Retreader you can make as much as $25 Profit or more per day

New Improved Double Acting Plunger

One Tire Repairman Writes:

"I stapled 10 casings at $2.50 each, and more than paid for the **Ewald Tire Retreader** the first day."

You can do as well, for there is plenty of this profitable business everywhere. The present prices of tires make it necessary for every car owner to get the maximum service out of them.

Making one serviceable tire out of two badly worn casings is economy for the car owner, and profitable for the repairman.

OUTFIT INCLUDES

Retreading Machine.
250 Special Staples, ½ in. long.
250 Special Staples, ⅝ in. long.
250 Special Staples, ¾ in. long.
250 Special Staples, ⅞ in. long.
Full Sheet of Instructions.
1 Can Tire Cement.
1 Can Talcum.
1 Cement Brush.
1 Tracing Wheel.
1 Tire Spreader.
1 Trimming Knife.
2 Rolls Rubber Reliner.
1 Shipping Box.

Price, Complete as Shown, $20.00

Every garageman, repairman and tire repair shop needs it! This is your big chance for quick and substantial profits. Write today for particulars.

The Inland patented Spiral Cut makes a mechanically perfect piston ring in *one piece.*

The Spiral Cut eliminates the gap and produces a ring that *uncoils* against the cylinder wall, making a perfect seal. Special treatment of free ends makes ring, *when compressed,* a perfect circle, preventing free ends pressure.

The uncoiling action of the Inland *takes up* wear on the cylinder so that perfectly *even* and perfectly gas-tight pressure is continually maintained.

The Spiral Cut also permits making a ring of equal width and thickness all around – no weak or thin places—the strongest and most durable construction.

Dealers: Inland sales are now on a basis of *millions* per annum. Are *you* selling Inlands? Jobbers everywhere stock them–ask yours.

Don't Fool With Poor Hand Warmers

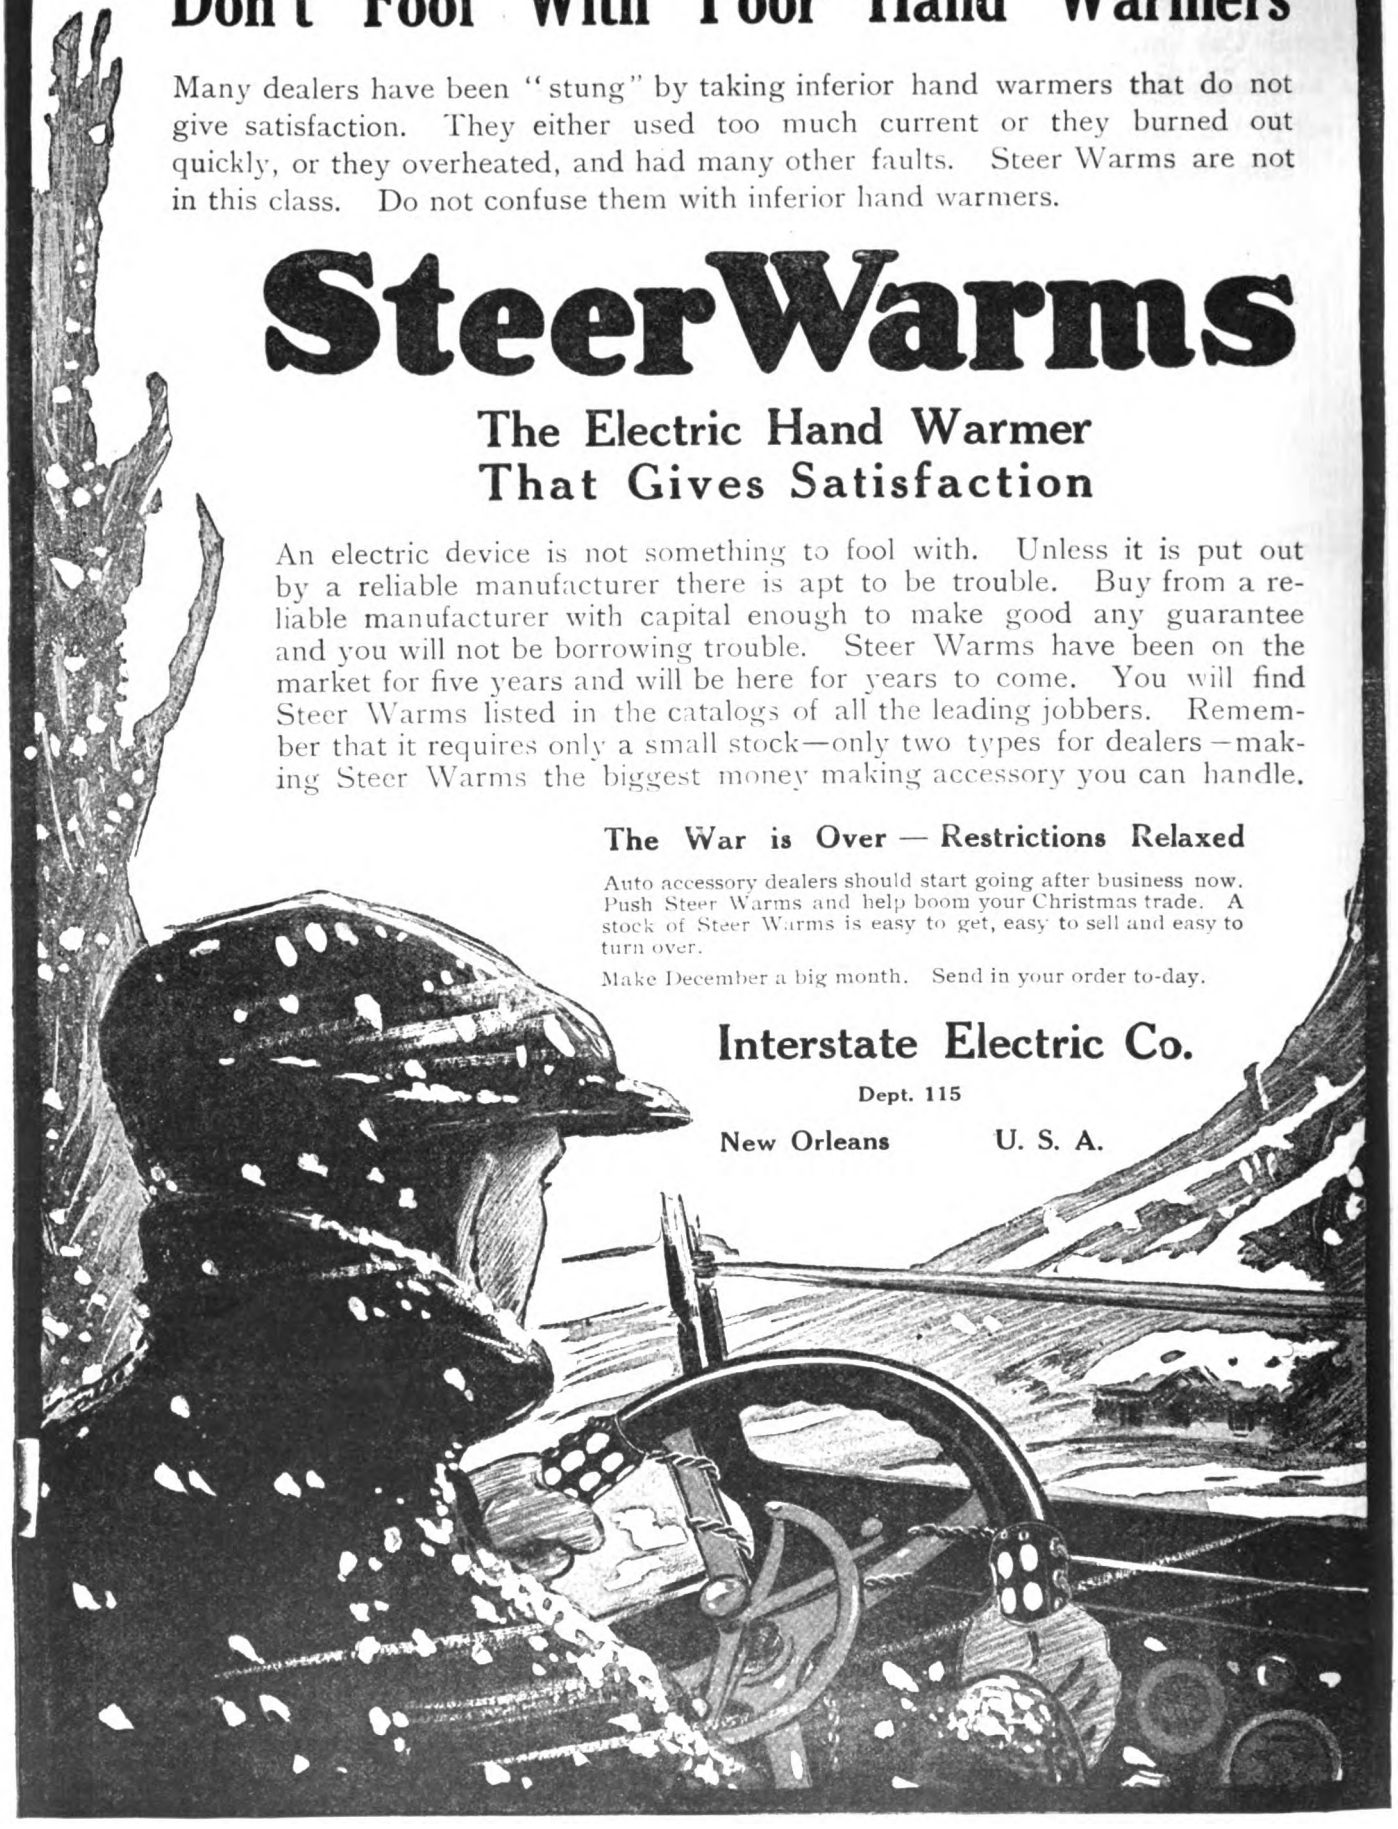
Many dealers have been "stung" by taking inferior hand warmers that do not give satisfaction. They either used too much current or they burned out quickly, or they overheated, and had many other faults. Steer Warms are not in this class. Do not confuse them with inferior hand warmers.

SteerWarms

The Electric Hand Warmer That Gives Satisfaction

An electric device is not something to fool with. Unless it is put out by a reliable manufacturer there is apt to be trouble. Buy from a reliable manufacturer with capital enough to make good any guarantee and you will not be borrowing trouble. Steer Warms have been on the market for five years and will be here for years to come. You will find Steer Warms listed in the catalogs of all the leading jobbers. Remember that it requires only a small stock—only two types for dealers—making Steer Warms the biggest money making accessory you can handle.

The War is Over — Restrictions Relaxed



Auto accessory dealers should start going after business now. Push Steer Warms and help boom your Christmas trade. A stock of Steer Warms is easy to get, easy to sell and easy to turn over.

Make December a big month. Send in your order to-day.

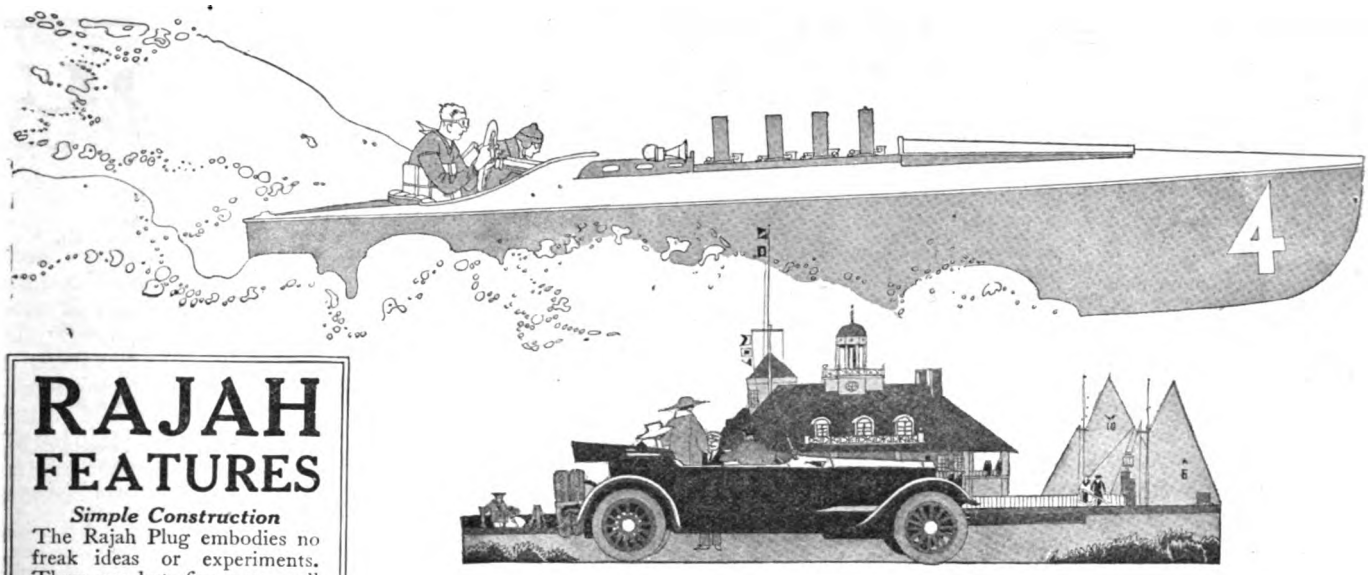
A SURE SIGN of carbon is a smoky exhaust, due to lubrication getting *past* the piston rings up into the combustion chambers where it *burns*. Leaky piston rings waste as high as 25% gasoline —one drop in four.

HI-COMP PISTON RING

THE RING THAT MAKES THE MOTOR SING

are the best gas-tight rings for overcoming engine troubles due to carbon—knocking, skipping, faulty ignition; valve pitting, wearing down of cylinder walls, piston and piston rings; smoky exhausts.



Hi-Comp Piston Rings are made from two perfectly balanced perfect eccentric rings into one absolutely gas-tight concentric ring. Each ring ground under oil — not buffetted — to preserve the true temper of the secret process gray iron and ensure high polish and gas-tight fit. Won't wear cylinders out of round — *proof* of gas-tightness. Make reboring of average cylinders unnecessary — an exclusive Hi-Comp advantage. Hi-Comp Piston Rings deliver every ounce of power from every drop of gasoline on to the piston head — no power or oil can get past them!

It will pay you to install Hi-Comp because of the satisfaction they give to you and your customers. Fully guaranteed by an old established piston ring company to give MORE POWER on less gasoline and oil. Write for booklet, specification chart and details of 90-day trial guarantee

RAJAH FEATURES

Simple Construction
The Rajah Plug embodies no freak ideas or experiments. There are but five parts, all interchangeable, easily taken apart, cleaned and assembled.

Knife Edge Bushing
adjusts itself to the shoulder of the porcelain. All possibility of injuring the porcelain is thus eliminated when the bushing is tightened down to secure a gas-tight joint.

Insulation
consists of the highest grade, hardfire, heat-resisting porcelain, of special pattern, so assembled as to insure against firing through.

The Button Top and Rajah Clip Terminal
do away entirely with the necessity for either thumb screw, nut or other device for attaching the cable to the spark plug.

Rajah Terminals and Adapters
are furnished so that Rajah Plugs can be used with any car.

Rajah Regular and Ferrule Clip Terminals
Adjustable to any cable and with ferrule to fit any cable. With the extra collar supplied both can be used with any make of plug.

Rajah Thumb Nut and Stud Terminals
The Thumb nut is an adapter for Dodge, Ford, Hup, Hudson, Maxwell, Mitchell, Packard Twin Six and Pullman. The Stud for Buick, Chevrolet and Oldsmobile.

Rajah Ball Terminal
Adapter for Franklin, Locomobile and Willys-Knight.

Manufactured by
Rajah Auto-Supply Co.
Bloomfield, N. J.
Sales Department
Edward A. Cassidy Co., Inc.
280 Madison Ave., New York

The plug that puts power behind the pistons

In speed boats, racing cars and airplanes, Rajah Plugs unfailingly deliver the quick, hot spark that turns gasoline into power.

Rajah Plugs were used in the Hispano-Suiza motor when the world's altitude record of 28,900 feet was established at Dayton, Ohio, September 18th, 1918.

The automobile owner, who wishes to have available in his car the last ounce of power and be forever free from ignition troubles, should need no stronger endorsement than this.

The reputation of the Rajah is rapidly spreading through our national advertising and through the recommendations of satisfied users. Take advantage of this Rajah demand. It means quick and easy sales.

NOTE—Sell a complete set of Rajah Plugs to every customer. The delightful sense of quick response, increased power and absolute dependability will add to his satisfaction and hold his trade.

NEW YORK SHOW NUMBER

OF THE

Automobile Dealer and Repairer

Our Regular January, 1919 Issue

Final Forms Close January 5th, 1919

Owing to the fact that the decision to hold a NEW YORK AUTO SHOW came so late in the season, there is naturally a limited time to fill your order for advertising space. Therefore, a very prompt response is requested, as we shall be obliged to handle a great deal of advertising copy in a short time.

Why not let us get up the right kind of copy in our "Put-It-Over Department"? If you don't know what we mean by this, write us and we will be glad to explain.

This will be the first NEW YORK SHOW since the dawn of Peace and it is more important than ever before for you to be represented in our magazine with a good strong announcement.

Don't wait or you may be too late to secure the best position and service.

Write or Wire, Now, to

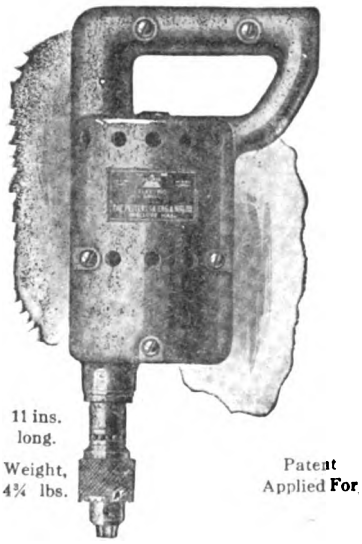
BILT-RITE

TRADE MARK

BILT-RITE

An Up-to-the-Minute
COMBINATION DRILL & VALVE GRINDER

It Is Electric and Portable



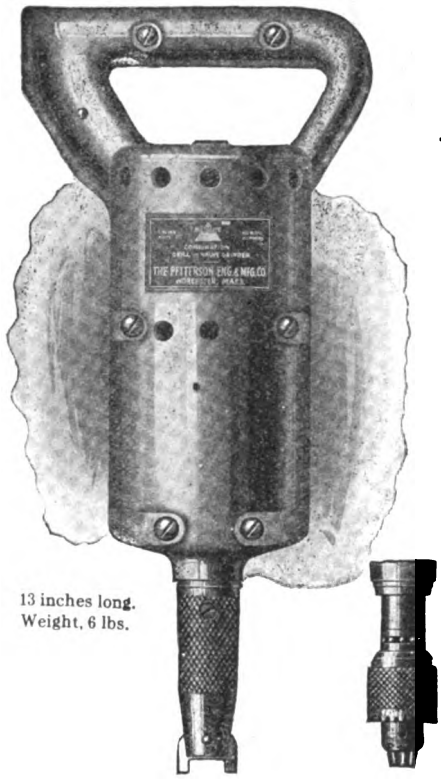
BILT-RITE has a more direct bearing on the Repairman's success than any other tool ever invented—for the best reason in the world—it is two indispensable Tools in one—at the price of one. When not in use grinding your valves, **BILT-RITE** is always available for small miscellaneous drilling so frequently a part of the day's work in any garage repair shop. The change from one operation to the other is made in the fraction of a minute!—The mechanical features remaining the same.

BILT-RITE contains no empty talking points—and no frills to make it impressive. It is absolutely dependable in its double capacity.

Every conceivable precaution conducive to durability has been carried out. Ideal bearing surfaces, with proper distribution of material at points of greatest strain, makes possible a relatively light weight consistent with strength and endurance. The entire mechanism is enclosed and protected in an aluminum casing.

BILT-RITE is a power as real in its own realm as the physical energy radiated by the Sun. It is a masterpiece of mechanical simplicity.

No more experience is required to use a Combination Drill and Valve Grinder than to use the telephone. Besides saving shovelfuls of dollars it does the work quicker, better, even with unskilled labor, and certainly more uniform than it could possibly be done by hand.



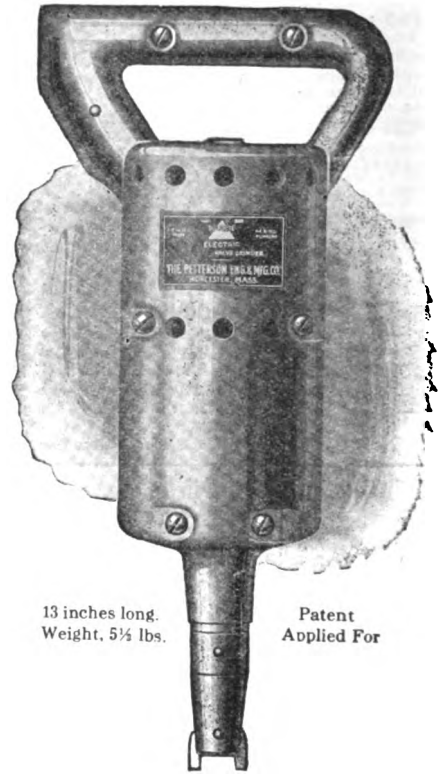
11 ins. long.
Weight, 4¾ lbs.

Patent Applied For

BILT-RITE
Portable Electric Drill

Put new sparkling enthusiasm in the shop! Get the work out! Those small odd drilling jobs can be handled quicker and better with a light portable Electric Drill.

For instance, it certainly isn't practical to use a large Power Drill on ¼-inch work, and it's too slow and tedious to do similar work with a breast drill. Therefore, a **BILT-RITE** Portable Electric Drill embodying distinctive features in design, insuring unquestionable endurance, is a timely and profitable investment.



13 inches long.
Weight, 6 lbs.

BILT-RITE
Combination

For Valve grinding or for Drilling Holes up to ¼-inch in diameter, giving you the familiar oscillating motion for valve grinding and the required speedy motion for drilling, neither operation interfering with the other in the slightest degree.

Correspondence solicited from reputable dealers everywhere.

13 inches long.
Weight, 5½ lbs.

Patent Applied For

BILT-RITE
Electric Valve Grinder

The vigorous and constant electric masterworker that cuts down labor two-thirds and puts quick action on slow jobs.

There isn't a more tiresome job in the Auto Repair Shop than hand valve grinding. A **BILT-RITE** Electric Valve Grinder is never tired—whether it's the first or last valve does not make any difference; obviously, more uniform results obtain even with unskilled labor.

Grinds Valves on Automobiles, Auto Trucks, Aeroplanes, in fact any internal combustion engine where the valve does not exceed three and one-half inches head diameter. **BILT-RITE** is a profit multiplier for you—see the point.

"THAT'S THE TOOL FOR ME!"

BILT-RITE

BILT-RITE

TRADE MARK

Conceded by experts to be the most capable tool in the world—displacing at one blow all ordinary Electric Portable Drills on account of its double capacity—grinding valves, and by quick change drilling holes.

NO OUTSIDE projections interfering with work in close quarters. Smooth and compact. Perfect interchangeability of parts. Mechanism divided into four parts. Parcels post will deliver any part on short notice.

Button Switch in handle located conveniently to finger, starts or stops machine instantly. Lubrication: gearing system packed in grease. Oil holes for Motor, Oscillator, and Drill Shaft bearings.

Substantially housed steel gears throughout, no gear less than thirteen teeth. A Split Casing. Removal of screws holding casing together exposes whole interior, facilitating repairs and replacements.

A "Service Agreement" supporting the endurance claims we make on all **BILT-RITE** products will be furnished the purchaser upon application direct to the factory or Distributor.

A Million Motorists Use It 4,000,000 More Need It

The limited supply and increasing cost of inner tubes makes it necessary for motorists to repair punctures, cuts, tears and cracks—to keep their tubes in good repair These conditions make it imperative for motorists to stop the easy-going, wasteful habit of carrying $5 to $15 worth of spare tubes—that deteriorate quickly—and scrapping perfectly good inner tubes that merely have a puncture, cut or tear—which can be repaired *permanently* with a Shaler 5-Minute Vulcanizer, quicker than a new tube can be inserted.

Saves Tubes—Saves Repair Bills

You can repair your own tubes—as good as new. It's easy and inexpensive. *The Shaler works automatically* —and without fail. Just touch a match to the non-flaming chemical fuel. In five minutes you have a firm, flat, "feather-edge," permanent repair—stronger than any "stuck on patch"—stronger than the tube itself. No gasoline, cement or flame, and no danger of injuring the tube. Carry it in your tool box for emergency use. It works in the wind, in any weather, anywhere The heat is applied directly to the pure gum patch and does not extend to the tube itself.

Complete Outfit Only $1.50

The outfit includes, the Vulcanizer—12 Patch & Heat Units (6 round for punctures, and 6 oblong for cuts)—complete, $1.50. Extra Patch & Heat Units 75 cents per dozen.

Sold By Accessory Dealers and Jobbers

TO DEALERS—To insure shipments—it is advisable to order from your jobber now. The great demand has exceeded our factory capacity and shipment will be made according to priority in receipt of orders

Catalog of the Complete Shaler Line of Vulcanizers for Motorists, Repair Shops and Garages mailed on request.

IMPORTANT POINTS ABOUT PAINT AND VARNISH BRUSHES

A Set of Three Brushes and the Automobile Dealer and Repairer for One Year for $2.00

Brushes Needed in Repainting and Varnishing an Automobile.

Did it ever occur to you that there was much difference between a good paint or varnish brush and a poor one? Probably not. To most people a brush is just a brush. Yet an analysis shows that there is an almost measureless difference between a good brush and poor one.

For instance, a properly made Flowing Fitch brush is hermetically sealed, so as to keep the paint, or whatever may be used, from getting into the brush at the top and loosening the hairs. All such properly made brushes are solidly set in glue cement inside a leak-proof ferrule, and a whole row of neatly clinched nails are driven in at the end of the ferrule to give added security, and a guarantee that the hairs will not pull out.

A Fitch brush is *smooth*, *soft*, and *flowing*, and does not "mush" up or get flabby like a cheap brush, but holds its springiness. The trouble with cheap brushes is that the ferrule is nothing more than a single band of tin, open at the top, with a couple of nails jabbed through. When you use such a brush the cheap hair will pull out and scatter all over your work, because it is not held in securely enough to stand the drag of the brush in painting or varnishing.

A brush may be washed with gasoline or kerosene oil, but to clean it thoroughly turpentine should be used. No brush used for painting should be used for varnishing.

We have recently made arrangements with one of the best manufacturers of these properly made brushes in New York to offer a set of Three in connection with a subscription to the AUTOMOBILE DEALER AND REPAIRER for a year for an even $2.00. These brushes sell at retail for $1.40. It will be seen, therefore, that there is a substantial advantage in sending to us for the AUTOMOBILE DEALER AND REPAIRER for a year, and for a set of these brushes.

Present subscribers can have their subscriptions extended for a year, and secure a set of brushes, on the same terms. These brushes are guaranteed in every respect, and though they cost more than cheap brushes would cost, they are far cheaper in the end, because of their lasting qualities and the good work that can be done with them. No man can afford to waste expensive paint and varnish on an automobile by using a cheap and poorly constructed brush, such as is usually to be found wherever brushes are sold. The ordinary dealer in brushes himself as a rule has very little knowledge of the quality of the brushes he sells.

Remit by check or money-order, and your name will be entered as a subscriber to the AUTOMOBILE DEALER AND REPAIRER for a year, and a set of these brushes, which are just the right size and shape (see illustration, which is exactly one-half the actual size of the brushes,) will be sent to you, postage prepaid.

ARE YOU OVERLOOKING DOLLARS?

THE HEINTZ ELECTRIC STEAM VULCANIZER

will add a money making department to your business—your help is needed right now at Tire Repairing, there is so much work to do. The Heintz Electric Steam Vulcanizer is a master worker in this line. It is not an old-style machine. It is a new, fast working Vulcanizer patented April 9th, 1918, with other patents pending.

No. 1. No danger of fire or explosion.

No. 2. It does perfect work.

No. 3. Vulcanizes by steam heat.

No. 4. Heated by electricity from lighting socket.

No. 5. Steam pressure and temperature automatically controlled. No attention required.

No. 6. No boiler or fireman needed. No watching of steam pressure.

Made in Two Sizes for TIRE SHOP, GARAGE OR REPAIR SHOP.

Consumes less electricity than an electric flatiron. Capacity large. It is a high class Vulcanizer at a low price. It is a splendid paying proposition because Vulcanizing will last as long as automobiles are made.

Write us for prices and description today—Right now is a good time while it's on your mind.

JAS. C. HEINTZ & CO., 2073 East 9th Street, CLEVELAND, OHIO

Canadian Distributors:—Canadian Fairbanks-Morse Co., Montreal, Que.

$3.82 SEVENTH EDITION $3.82
DYKE'S AUTOMOBILE ENCYCLOPEDIA

Entirely re-written, hundreds of illustrations and many new subjects added. Practically a new book. A non-technical treatise with simplified illustrations on Constructions, Operation, Repairs and Adjustments, Cares and Troubles of the Automobile.

There are 50 Instructions—Simplified and practical.

3500 Illustrations—the kind you understand at a glance.
3 Supplements, parts printed in colors, treating on the construction, operation, repairing and adjusting of the **FORD** and **PACKARD**—tells how to make a Ford do 60 miles per hour; how to get more mileage per gallon; how to convert into a truck, racer, fine point adjustments, etc. **Airplane Supplement.**

775 Illustrations and 279 pages on **Electric Ignition, Electric Starters and Generators**, etc.

51 pages and 264 illustrations on **Adjustments, Tests**, etc., of leading **Electric Systems.**

154 pages and 1189 illustrations on Repairing. Oxy-Acetylene welding, and subjects as Repairs on all types of Axles, Differentials, Steering Devices thoroughly covered—as well as all parts of the Engine.

16 pages on Digest of Troubles.

6000 lines to the Index. This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. **Index begins on colored paper, easy to refer to.**

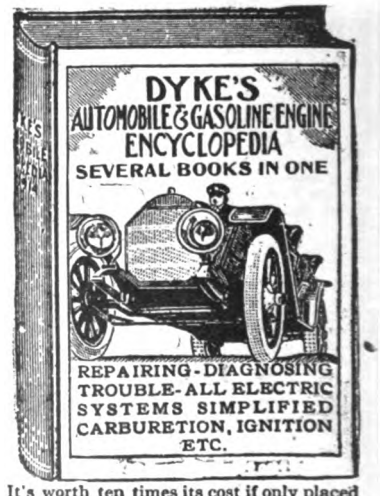
Dictionary is also included, which gives the meaning of motoring terms.

Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

NEW ADDITIONS
TRUCKS, TRACTORS, MOTORCYCLES, AIRPLANES AND AIRPLANE ENGINES.

Price $3.82, Prepaid, Express.

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

THE GREB COMPANY, Manufacturers of AUTOMOTIVE AND GARAGE EQUIPMENT. 197 State Street, Boston, Mass.

Here's The *One* Pedal for *Every* Purpose

No other is like it in construction—no other can be like it in results. Whatever your requirement may be, the Petry Universal Pedal will meet that requirement in a way that could never be met before. Made of high-grade steel, with special processed gun-barrel finish, the Petry Pedal is adjustable to pull or push for muffler cut-outs of any style, kind or size; Accelerator, Exhaust Whistle or Horn—and Heater Valve.

The PETRY UNIVERSAL PEDAL

is the only pedal which can be satisfactorily used on the toe-board. Why bother with an out-of-date pedal which must be disconnected each time you remove the floorboard for lubrication or other purposes? Write for circular today — and, remember, we can make immediate deliveries if you order at once.

N. A. PETRY COMPANY, Inc.
1313 Race Street, - - PHILADELPHIA

Distributers: Gray-Heath Co., 1440 Michigan Ave., Chicago, Ill.
Norman Cowan Company, 433-435 Rialto Building, San Francisco, Cal.

To Jobbers: Why tie up money in a large line of Pedals when the Petry Universal Pedal answers every purpose?

Are You Wasting or Saving Gasoline?

Cold weather means lower motor efficiency. If your motor is choked up with carbon, **you are wasting gasoline!** When you have the carbon deposits scraped or burned away, **you are pouring gasoline down the sewer,** because **Carbon is Power.**

Consume the carbon deposits with

CARBON-X

The Guaranteed Carbon Consumer

Thus **utilizing** the wasted power, and then **keep your motor clean** with a small application of Carbon-X every four or five hundred miles. **Don't throw away gasoline!**

Carbon-X positively **will not injure** the interior of any motor, nor affect the lubricating oil in any manner.

DON'T "LAY UP" YOUR CAR—DRIVE IT!

Carbon-X is made only in tablet form, and is packed 30 tablets in a screw-top carton. It is handy to carry in the tool box, and simple and easy to use. While the motor is warm, remove the spark plugs and insert the desired number of Carbon-X tablets in each cylinder according to directions on the carton. Replace the spark plugs and **drive the car.**

The car-owner takes no chances in buying Carbon-X—we take all the risk. This broad, unqualified guarantee furnishes unprecedented protection—and it means just what it says:

Every Package contains Satisfaction—
Money Refunded if you don't find it.

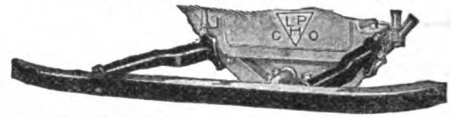
We could not afford to print this guarantee on every carton if Carbon-X did not "deliver the goods."

MR. CAR-OWNER: Many dealers have not yet stocked Carbon-X. If your dealer cannot supply you, send us his name and a dollar bill and we will mail you the regular $1 carton containing 30 tablets, postpaid.

MR. DEALER: To save time, order a dozen cartons of Carbon-X direct, giving us instructions to bill through your jobber. Initial order will be shipped prepaid.

MR. GARAGE MAN: If your territory is not already covered by Carbon-X Service, ask about this big-money-making, bring-'em-back-for-more Carbon-X Service Station plan. It's different.

Ask for our unusual book—WHY IS CARBON?—it's free.



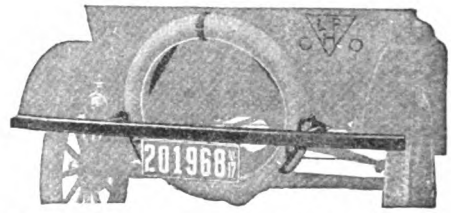
"C-P" CHEMICAL COMPANY, 305-326 River St., Chicago, Ill.

THE MARK OF QUALITY

LP CHO HALLADAY

HELPS for FORD Cars

HALLADAY BUMPERS



The Halladay Front Bumper for Ford cars is too well known to need detailed description.

It is built for hard service, is quickly attached, and stays put.

It is the strongest and lightest front bumper for Ford cars on the market.

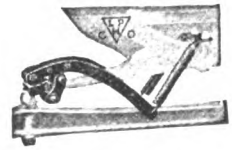
REAR BUMPER

With or Without Tire Carrier

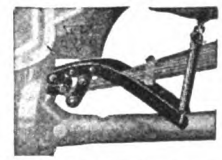
It is secured to the car frame only, without cutting or altering.

The top support of the tire is an extension from the tire cradle and is in no way secured or attached to the car body.

HALLADAY TILTING STEERING WHEEL



A rigid, non-rattling steering wheel, quickly attached in place of the regular wheel.



Locks automatically and is released by pulling a trigger

Furnished complete with rims or spider only

15 and 17 inches in diameter

HALLADAY FLEXLEVERS

The most efficient and easily attached Shock Absorbers ever put on a Ford car.

The latest improvement includes **all steel construction,** double arms and springs, with hardened steel pins in malleable steel bearings.

Flexlevers are the only shock absorbers of this type that can be attached without removing the wheels or spring perches.

THE DIFFERENCE

between what seems to serve and what really does serve is now measurable because you have a standard starting point.

Any old thing as a clutch seemed to be good at one time until we took the "see" out of seemed and put it where it belonged—in

The "Evans" Model

"HELE-SHAW" CLUTCH

(It is Patented)

The "Hele-Shaw" Clutch (for motor cars and all other mechanical drives) is the result of constant experiment and experience—a costly and aggressive initiative to prove that none of us need stay in a groove—that efficiency in a clutch could be obtained by looking at the whole idea as a coveted attainable prize worth winning.

Our "Hele-Shaw" Clutch was exclusively specified by the United States Government for use in three-ton Artillery Tractors. Thousands of "Hele-Shaw" Clutches are standard equipment in four-wheel drive Government Trucks.

In theory, design and actual results gained, it is undoubtedly unique in the art and the most advanced to date. For the best—the very best results, we believe it advisable for clutch users to employ these

CERTAIN AND SETTLED RESULTS

in their work instead of risking the old, or untried fields. Make us prove it—write for full particulars and catalog.

We are also the Manufacturers of

Evans Universal Joints, M. & E Grease Cups and Babbitt Metal

Guaranteed Satisfactory, or Money Back
Write for free booklet A-2. Sold by leading jobbers

"NO-LEAK-O" PISTON RING CO.
AUTOMOBILE ACCESSORIES CO.

Bulletin No. 3

DESIGN AND EFFECT

"NO-LEAK-O" Design—A groove cut around the ring at right angle with the face sloping at an angle of about 45 degrees. The groove passing between the sliding face, forming the lap and the side of the ring. Patents allowed. Patents pending. Trade-marks registered.

In one direction the square edge gathers the surplus oil. In the opposite direction the oil is distributed again, from the sloping face, pulsating as it were, preventing the groove from clogging.

Years ago plain piston rings were made with grooves. They were not a success, and abandoned. Imitations of "NO-LEAK-O" rings are now springing up all over the country; they are not a success, because they are not mechanically correct. Not made of same material, not made under same processes.

A ring made by any other process or material or a grove cut in any other shape or position or in any other way will not produce results that "NO-LEAK-O" rings do.

Mr. Repairman, Listen! This is Your Harvest. Don't Neglect It.

There are over 4,000,000 automobiles in the United States, say nothing of commercial trucks, tractors, etc. Old cars are being rebuilt. *War or no war* they must be kept running. "No-Leak-O" "oil SEAL ing" Piston Rings are *unlike any other ring* on the market. Simple, *one piece*, tough and springy, easy to install, not liable to break, and popular in price *Send a trial order at once.*

Oxigene

MOTOR AND DECARBONIZER FUEL SAVER

¶ Complete Combustion of Gasoline by Oxygen Gas. There is nothing like OXIGENE. The Principle is correct. Burns all the fuel and economy must result.

Oxigene won the highest honors in its class at the recent test of fuel economizing devices held by the New York Herald at the Motor Speedway, New York. The official published record showed an average increase in mileage **over 50 per cent** due to Oxigene.

GUARANTEE

Oxigene is harmless.
Oxigene will increase the mileage 25 to 50 per cent.
Oxigene will prevent the formation of carbon.
Oxigene will remove carbon deposits.
Oxigene will give more power and better pick up.
Guaranteed to contain no picric acid, camphor, ether, acids or corrosives.
If these results are not substantiated by actual use **we will promptly refund the full purchase price.**
5-ounce bottle, enough to treat 50 gallons of gasoline, $1.00. Quart can, $5.00.

Which Garage Man Gets The Money?

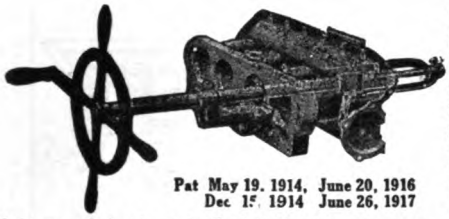
If you can repair and adjust Electrical Equipment, you will get the cream of the garage business. With the increasing demand for services of this sort, you must equip to handle the business, or lose it to your more enterprising competitor.

Weston

Model 280

GARAGE TESTING INSTRUMENT

is your one great and urgent necessity to enable you to locate electrical troubles quickly and apply the proper treatment to remedy them. Its possession will place you a long way ahead of your competitor not so equipped. This instrument is extremely accurate, durable and serviceable. It is the most practical electrical equipment you can install.



The Weston Company is pre-eminent throughout the world in the production of highest grade Electrical Precision Instruments.

We are returning to normal conditions as rapidly as possible, but we necessarily must complete government work in hand before full normal service can be rendered.

Your Family Car—
Is it Safe?

IT'S hard to concentrate your mind on business, isn't it, when you think of the many terrible things that might happen to your family automobile ***and its passengers?***

Fast driving is responsible for three out of every four accidents you read about in the paper. Chauffeurs at their best are irresponsible and have a habit of speeding when not constantly watched. Perhaps your son or daughter does most of the driving—don't forget that they are more careful when you are along than when you are at the office. Youth is very self-confident and knows no danger, but one spurt of speed may result in a disastrous skid or collision.

For your family's sake, there should be a PIERCE GOVERNOR on your automobile. You can set and seal the governor for any desired speed and no matter who the driver is, or when or where your car is driven, it cannot exceed the speed you have designated. The governor can be reset for different speeds as often as you desire.

PIERCE GOVERNORS are not an experiment. They are now regular equipment on eighty-nine prominent makes of motor trucks and will soon be equally popular on passenger cars ***Governor installations must be made by the automobile manufacturer.*** When you buy your next car, demand that it be Pierce equipped. It will save you many a worry.

STAR PRICES GUARANTEED

Every purchaser of Star Lathes during the year 1919 is guaranteed against any decline in present prices.

Should lower manufacturing costs, or any other cause, warrant a reduction in the prices of Star Lathes, rebates covering this reduction will be given the purchaser. A certificate to this effect accompanies each purchase.

Star Lathes have been made for the past 35 years by a concern known for its reliability, excellent manufacturing methods and superior products. Thousands of machine shops, factories and garages, as well as Government plants, operate Star Lathes for high quality work and low operating cost. These lathes perform the work of heavier and more expensive machinery and give excellent satisfaction.

Don't put off ordering that Star Lathe another day.
We protect you against any price decline.

Star Lathes are made in 9-in., 11-in., and 13-in. swing sizes. A full line of attachments available.

Are You Wasting or Saving Gasoline?

Cold weather means lower motor efficiency. If your motor is choked up with carbon, **you are wasting gasoline!** When you have the carbon deposits scraped or burned away, **you are pouring gasoline down the sewer,** because **Carbon is Power.**

Consume the carbon deposits with

CARBON-X

The Guaranteed Carbon Consumer

Thus **utilizing** the wasted power, and then **keep your motor clean** with a small application of Carbon-X every four or five hundred miles. **Don't throw away gasoline!**

Carbon-X positively **will not injure** the interior of any motor, nor affect the lubricating oil in any manner.

DON'T "LAY UP" YOUR CAR—DRIVE IT!

Carbon-X is made only in tablet form, and is packed 30 tablets in a screw-top carton. It is handy to carry in the tool box, and simple and easy to use. While the motor is warm, remove the spark plugs and insert the desired number of Carbon-X tablets in each cylinder according to directions on the carton. Replace the spark plugs and **drive the car.**

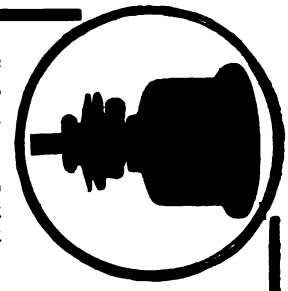
The car-owner takes no chances in buying Carbon-X—we take all the risk. This broad, unqualified guarantee furnishes unprecedented protection—and it means just what it says:

Every Package contains Satisfaction—
Money Refunded if you don't find it.

We could not afford to print this guarantee on every carton if Carbon-X did not "deliver the goods."

MR. CAR-OWNER: Many dealers have not yet stocked Carbon-X. If your dealer cannot supply you, send us his name and a dollar bill and we will mail you the regular $1 carton containing 30 tablets, postpaid.

MR. DEALER: To save time, order a dozen cartons of Carbon-X direct, giving us instructions to bill through your jobber. Initial order will be shipped prepaid.



MR. GARAGE MAN: If your territory is not already covered by Carbon-X Service, ask about this big-money-making, bring-'em-back-for-more Carbon-X Service Station plan. It's different.

Ask for our unusual book—WHY IS CARBON?—it's free.

"C-P" CHEMICAL COMPANY, 305-326 River St., Chicago, Ill.

THE DIFFERENCE

between what seems to serve and what really does serve is now measurable because you have a standard starting point.

Any old thing as a clutch seemed to be good at one time until we took the "see" out of seemed and put it where it belonged—in

The "Evans" Model

"HELE-SHAW" CLUTCH

(It is Patented)

The "Hele-Shaw" Clutch (for motor cars and all other mechanical drives) is the result of constant experiment and experience—a costly and aggressive initiative to prove that none of us need stay in a groove—that efficiency in a clutch could be obtained by looking at the whole idea as a coveted attainable prize worth winning.

Our "Hele-Shaw" Clutch was exclusively specified by the United States Government for use in three-ton Artillery Tractors. Thousands of "Hele-Shaw" Clutches are standard equipment in four-wheel drive Government Trucks.

In theory, design and actual results gained, it is undoubtedly unique in the art and the most advanced to date. For the best—the very best results, we believe it advisable for clutch users to employ these

CERTAIN AND SETTLED RESULTS

in their work instead of risking the old, or untried fields. Make us prove it—write for full particulars and catalog.

We are also the Manufacturers of
Evans Universal Joints, M. & E. Grease Cups and Babbitt Metal

CONNECTICUT

TYPE "C" DIMMING SWITCH

THE man who desires to be able to dim the lights on his car—

But who hesitates because of the necessity of re-wiring it—

Will find in the Connecticut Type 2N with "C" resistance Dimming Switch the simplest and most satisfactory solution to his problem.

Here is the one switch which accomplishes its purpose without requiring the slightest change in the wiring of the car—

Pulling out one button puts on the headlights and the tail light—

Pushing it in shuts them off—

The position of the second button, however, determines whether or not the headlights are burning full or the current going to them is being choked and their light dimmed by the resistance coil.

We also make a series dimming switch—Type "D"—for use in conjunction with another switch.

This switch has no "Off" position. When the button is in, the lights are in multiple and are bright, but when the button is out, they are dimmed by being thrown into series.

"NORMA"

PRECISION BALL BEARINGS

(PATENTED)

National conservation, rightly understood, contemplates the manufacture, sale, and use of machinery and equipment possessing within itself the maximum of "staying power." Repairs and replacements on old equipment may be an economical virtue. But a truer conception of economy demands the making of machines so good that repairs and replacements are minimized.

Builders of high-grade ignition apparatus and lighting generators—and builders of the high-grade cars, trucks, tractors, power boats and airplanes on which they are used—know that the superlative dependability of "NORMA" Ball Bearings contributes largely to the trouble-proof-ness of any equipment of which they are a part.

Only 7c a Day

Not a cent to pay in advance. First you see the books in your own home or shop. Just mail coupon and pay express charges when books arrive. You can read them and study them for seven whole days before you decide whether you want to keep them or not. If you like the books send only $2 in seven days and $2 a month until the special introductory price of $17.80 has been paid. (Regular price $25.00.) Along with the set goes a year's consulting membership in the American Technical Society. (Regular price $12.) This great bargain offer must soon be withdrawn.

Send No Money Now

Don't take our word for it, **See the books without cost.** There is so much profit in this offer for you, that we urge you to waste not a moment in sending for the books. **Put the coupon in the mails today. Send no money—just the coupon!**

American Technical Society Dept. A-7551, Chicago, Ill.

American Technical Society,
Dept. A-7551, Chicago, Ill.

Please send me the 5-volume set, Automobile Engineering, for 7 days' examination, shipping charges collect. If I decide to buy, I will send $2 within 7 days and the balance at $2 a month until the $17.80 has been paid. Then you send me a receipt showing that the $25.00 set of books and the $12 Consulting Membership are mine and fully paid for. If I think I can get along without the books after the seven days' trial I will return them at your expense.

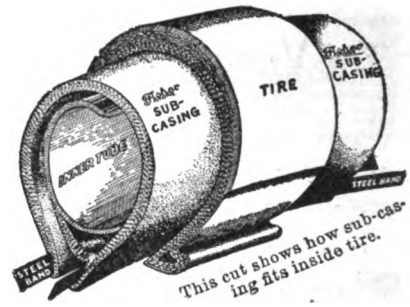
MORE MILES PER TIRE

LESS TIRES TO BUY

THE Fisher PATENTED "RIM-GRIP" SUB-CASING

The Blows That Your Tires Receive, When You Strike Objects in the Road, Leave Weakened Places in the Fabric

A TIRE IS AS STRONG AS ITS WEAKEST POINT



The weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings.

Write for Particulars

FISHER MANUFACTURING CO.

1706 Payne Avenue **Cleveland, Ohio**

This cut shows how sub-casing fits inside tire.

"NO-LEAK-O" PISTON RING CO.
AUTOMOBILE ACCESSORIES CO.

Bulletin No. 4—Special

"NO-LEAK-O" SPECIAL—The grooves in all pistons are a few thousandths wider than the ring to allow for expansion. On the down stroke, the ring is forced tight against the upper part of the groove by centrifugal force and vacuum. If the ring is not a good fit, the oil will pass under and behind it. On the up stroke the ring is forced down tight against the lower part of the groove, and the oil passes over the top of the ring and up into the firing chamber. As the ring wears, more oil is pumped up.

With "NO-LEAK-O" SPECIAL in the bottom groove (See illustration, Letter C), the oil which will cling to the cylinder wall is trapped in the groove by the square edge catching it, forcing it back into the oil pit.

"NO-LEAK-O" SPECIAL should be used in bad oil-pumping motors They will keep the oil down when other rings fail.

Mr. Repairman, Listen! This is Your Harvest. Don't Neglect It.

There are over 4,000,000 automobiles in the United States, say nothing of commercial trucks, tractors, etc. Old cars are being rebuilt. *War or no war* they must be kept running. "No-Leak-O" "oil SEAL ing" Piston Rings are *unlike any other ring* on the market. Simple, *one piece*, tough and springy, easy to install, not liable to break, and popular in price. *Send a trial order at once.*

Guaranteed for 10,000 Miles

EVERY Brictson Tire is sold under a specific 10,000 mile written service guarantee. This guarantee is the longest and strongest ever put behind a pneumatic tire and is a positive protection to every purchaser.

"Absolutely Puncture Proof"

Brictson Tires are puncture proof, and proof against blowouts, skidding, rut wear, rim cuts, and can't be damaged by oil or gasoline. Wonderful resiliency, easy riding qualities as well as economy commend them to car owners,

The Big One-fourth Retread Feature

Should the tread surface wear out after 10,000 miles of service you can get a new retread for one-fourth the original cost of the tire, instead of buying a new tire, and you keep the remaining three-fourths in your pocket. With ordinary service the Brictson Tire should run enough beyond the 10,000 miles to require one or two extra retreads. The more retreads you use the cheaper your service.

FREE TRIAL OFFER

To convince you the Brictson Tire will give satisfaction TRY THEM ON YOUR CAR AT OUR EXPENSE. Write today for this Free Trial Offer, a copy of our guarantee and full information about Brictson Tires.

"ALSOP-ALL-SPARK"

Ordered by War Department

Gives Two-Plug Ignition if desired
Saves Fuel and Spark Plugs
Gives More Speed and Power
Sparks Carbon-Choked Plugs
Causes Perfect Combustion
Gives More Powerful Spark
Eliminates Carbon & Vibration

Prevents running engine with a misfire and the delays from changing spark plugs on trips.

BY SIMPLY TURNING A DIAL ON DASH

Retail Price, $6.00

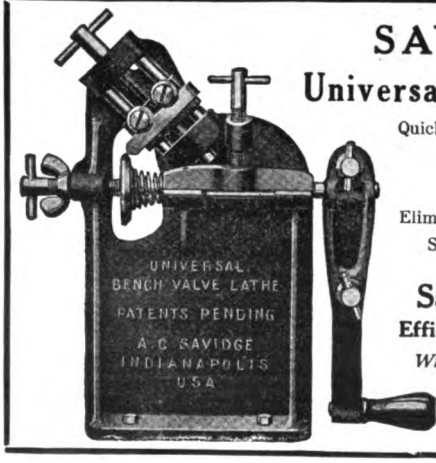
Dealers, write for a real sales proposition

ALSOP TRIPLE IGNITION CORP., 1765 BROADWAY, NEW YORK

Made from Oil-Tempered Spring Steel Wire

PATENTED MARCH 28, 1916

They Remove Carbon Where Others Will Not



Cut out experimenting—get down to business. Why not own a set of FLEXIBLE CARBON SCRAPERS? They are the only scraper on the market that will do a satisfactory job without taking the motor to pieces. Compounds are dangerous. All good mechanics advise scraping carbon. Over 100,000 sets now in use by Auto Mechanics.

Price Per set, $1.50. Ask Your Dealer or Write

Flexible Carbon Scraper Co. 1421 W. Washington St. Los Angeles, California

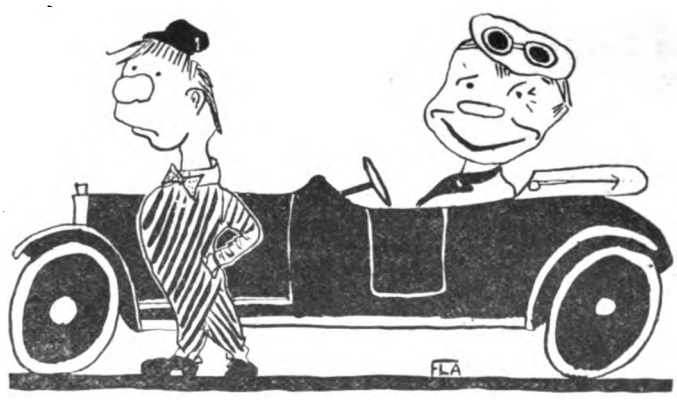
Why Does She Stop?



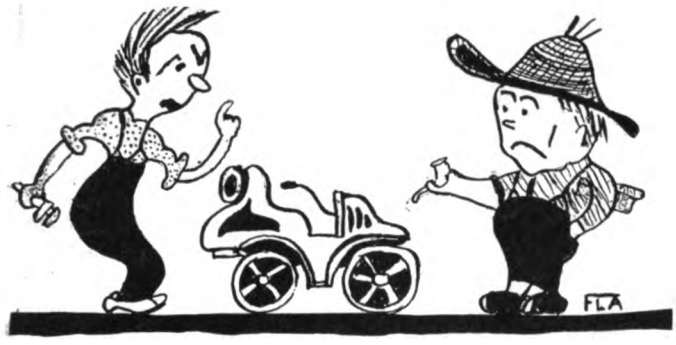
With a faltering pencil and a beating heart, I dash off this heading. I am taking my life in my hands; I am venturing upon an unmarked trail; I am sailing upon uncharted seas. In every book store I find volumes entitled "What Makes the Car Go?"; "Inside the Engine"; "How to Run an Automobile," and similar books; but to the best of my knowledge and belief, so help me Muse of Motordom, there is no work to be had which tells why the car don't run.

Mayhap or possibly there has lived a fearless author, who has ventured upon this work, but as he progressed, doubtless he has lost heart and finally consigned his unfinished manuscript to the scrap basket, never more to be the jaunty soul of the past.

There is one thought that cheers me, in compiling this story. Never yet have I seen anyone who gave a plugged nickel, a tinker's dam, or any of his loose change to find why his car went; he is satisfied, and well he might be, with the result; he holds his breath and only hopes that she will continue to "went" and not change her tense and be "gone."

AN advertisement in one of our popular magazines informs us to the effect that even a mere child can answer any of the appended questions, provided he has had the opportunity to consult a certain book of useful information. Among the questions I find "What makes the car run?"

Sure he can answer the question; one presses a little button, pulls down a lever, whispers a few words of encouragement, and presto! she goes. Maybe she doesn't go satisfactorily, but go she does, after a fashion. BUT, when she stops! Who is there who can give the reason? I still wait for an answer. An automobile and a mule are two souls that beat as one — this simile doesn't sound just right, but the fact remains. When they go — they go — and when



When She Goes, Nobody Cares Why—Everybody's Happy.

Digitized by Google

they stop—well, they just won't go, and no amount of sympathy, harshness, or force will accomplish the impossible unless one knows the mystic words which charm away the inherent stubborness of mules and cars.

Back in the good old days, when automobiles began to chug upon the highways, and fill the air with fumes of gasoline, cylinder oil, and profanity, I remember an old farmer who was a "jack of all trades." He pro-

"Our Hero Was on the Spot—Hometown Paper Under His Arm—Ready To Earn An Honest Dime."

fessed to be something of a veterinary and something of a mechanic, and so he combined the two, after a fashion, and hung around the village store, lying in wait for discouraged and disgusted motorists.

"Ca Chug, Bang," would go a dying engine, and our hero would hie himself to the spot, pipe in mouth, and look wise. Sooner or later the puzzled autoist would raise his eyebrows in a question and remark "whassa matter?"

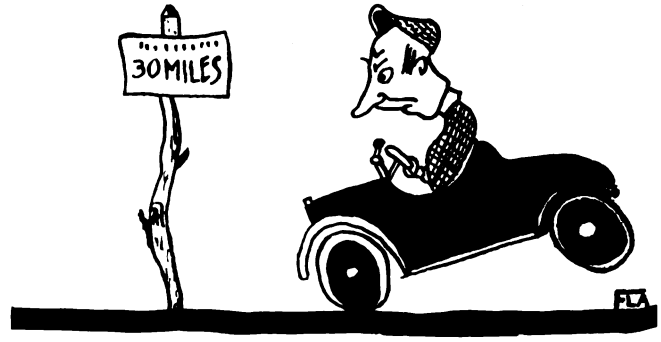
This was the signal for our friend. Forth from a voluminous coat pocket, or from beneath his arm, he would draw the latest copy of his home town newspaper and while the motorist turned his back (the work was mystic, you see, and our friend took no chances in giving away his secret), the farmer would painstakingly wrap up each dry cell in the paper. After collecting a dime for the work, the farmer would crank the machine and away it would go, like a mule who has the prospect of a full meal at the end of his journey.

The day of dry cells has passed, the mysterious storage battery has taken their place, the farmer long since has dropped into obscurity, but the big problem still remains —"Why does she stop?"

It is the question of the ages; from Alaska to the tip of California; from Labrador to Florida; vice versa and criss-cross run those little crinkles and question marks. Why, when a' nauto is given the best of nourishment, a bath once a week, a regular manicure of its tires, and a careful massage of its upholstery (occasionally or oftener), should it be so ungrateful as to go on a strike, like a dissatisfied labor union?

When a person dies, their demise is caused either by starvation or failure of their nervous system. So it is with the automobile; give it proper nourishment and don't let its "nerves" fail, and it is a thing of life. Cut off its steady supply of gasoline or forget to throw on the switch and it will no more exert itself than a torpedoed U-boat.

For the purpose of demonstration let us climb into our little flivver and journey into the country. We will pick out a road seldom frequented by autoists, one that leads us away from civilization and the gaze of the maddening throng. For two hours at a stretch we are lulled into a feeling of security, our engine purrs like a contented kitten and acts like a contented horse.



Ha! a signboard, upon which is inscribed "Scituate 30 miles," the flivver stops to read and having absorbed the information curls itself into a ball, just like that same contented kitten we compared it with in the last paragraph, and goes to sleep. It is always this way, when one is 'steen miles from anywhere; that's why I suggested the trip, just so that we could look for the answer to our problem, "Why won't she run?"

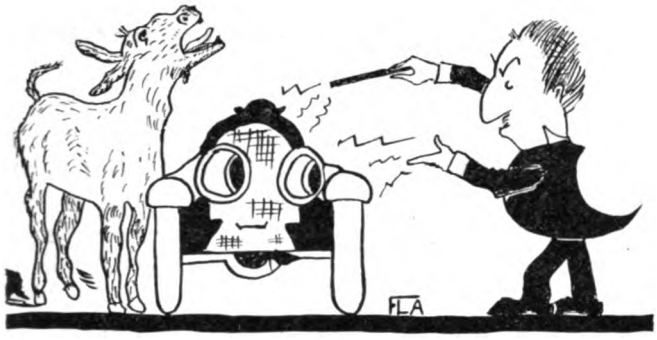
Let's go at the work systematically now, no—don't bother to crawl under the thing, you can work better from the top, unless you want to turn the car over. First, let's see if there is any gasoline in the carburetor. Unscrew that little cap over the inlet valve and see if you can press down on the float lever. No? Well then, you know that the carburetor float chamber is full of gasoline. Just open the drain cock in the bottom of the float chamber and draw off about a teacupful of the stuff.

Stopped up? Well, take a piece of wire and poke it out, then draw off the dirt. Maybe there is dirt in the needle valve. If you draw off the gasoline once a month you won't have that trouble. No, don't waste any time cranking her now.

Fill those pet-cocks with gasoline. Whoa! I didn't say open them and pour in a quart to each cylinder. One teaspoonful is plenty and a priming cock holds just enough. If you hadn't had those priming cocks, I would have made you remove the spark plugs from two cylinders and primed them through the top.

Push down on the starter button now and let's see what happens. Once is enough, don't think you have to

"Having Absorbed This Information the Flivver Calls It a Day—and Quits."



hold it down for half an hour unless you want to crank it by hand when the storage battery fails. Still asleep.

Now suppose one of you fellows removes the secondary wire from number one plug. Hold it about an eighth of an inch from the cylinder head. Try her again.

Digitized by Google

Sure, you've got to throw on the ignition switch. Now, believe me! If you hold that secondary wire that way, with your bare hands, you'll learn quite a few facts about electricity. Hold it by the insulation, not by the brass tip.

Don't get a spark in that cylinder at all, do you? That shows there is something wrong with the ignition system. We know that the engine has gasoline, for we fed it directly into the cylinders. But we know it doesn't get any spark. Let's look at the storage battery. Connections all tight. Probably would be all right if the start-

"Unless One Knows the Mystic Words Which Charm Away the Inherent Stubborness of Mules and Cars—She Won't Go."

ing motor worked all right. See that little wire that connects with the starting switch and runs to the dash. Tighten up the binding nut and chase it out, see that it doesn't ground at any point, see if it is broken.

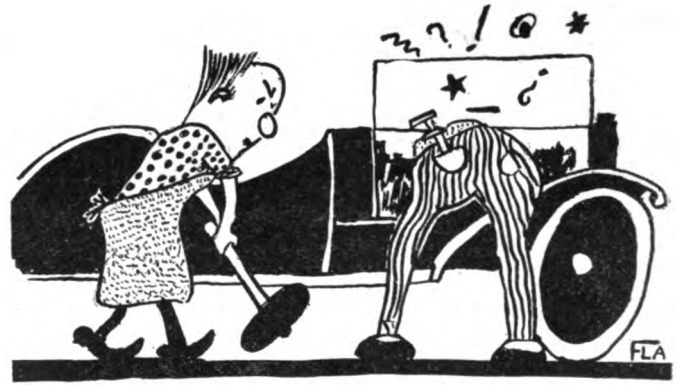
Just turn on the lights a minute. O. K. That shows that everything is right as far as the dash. Now let's look at the ignition switch. Contacts all good, sorter looks like—a bit of a puzzle, doesn't it? That's always the way a car acts when it knows that the nearest phone is ??? miles away.

That ignition system is what we call a single coil affair. One wire leads from the ignition switch to the coil, through it to the breaker box, and the current grounds inside the breaker box when the points are together and goes back through the frame and ground to the battery. Throw on the ignition switch and disconnect the wire leading to the breaker box from the coil. Touch it against the cylinder head. See that spark? That shows that the trouble is in the breaker box or connections.

Just for the fun of it lets connect the wire to the breaker box again and turn the engine over until the points come together. But we'll just slip a thin piece of paper between the points to break the circuit. Now one of you remove the secondary wire from the center of the distributor and hold it about a quarter of an inch away from the cylinder head. Now when I remove this piece of paper, I'll let the points come together for a second and snap them apart with my fingers rapidly; there should be quite a spark from that secondary wire. Let's try it. Nothing doing!

Just notice that the breaker points hardly come together. The things have burned away until they don't contact enough to make a spark. Now we will just file them off with a fine file until their faces are perfectly flat, then adjust them closely enough so that they will touch when the roll has traveled to the low part of the cam. Then we will turn over the engine until the breaker arm is on the top of the cam and the points fully separated. We'll readjust them so that they are apart about the thickness of a visiting card. If this is too far apart, they won't touch at all, and we'll have to adjust them again, just a little closer, until they touch when the roll is at the lowest part of the cam. Adjustments in different cars differ.

In the main and as a rule the visiting card answers the purpose. But always remember, the points must touch every time the roll travels into the valley of the cam.



Now we'll put the wires back, just as we found them. Crank her up, Percy, she goes like a top. You see how easy it is to find trouble in a single coil, grounded wire system.

* * *

No matter what kind of a car you happen to drive: when the thing stops, find whether the trouble is in the gas line or in the ignition. If she runs for a few explosions when you prime her—it's gas trouble. If she won't run after she is primed, it's probably ignition.

Don't bother to look into the gasoline tank, 'cause you may be misled. I remember the time, when I was young and green and owned my first car. I parked her carefully in front of my best girl's house and waited in the front parlor for the young lady. She took half an hour or so to powder her nose and fix her veil and finally we marched out to my bus for a nice long ride. When we arrived at the auto, cute little baby brother was playing house in it. We chased him out and started off.

We had driven probably two miles when the engine began to splutter, and just as we rolled into a peaceful little valley, hot as tophet and dreary as a Sahara sand dune, the engine fainted. Even in those days I had a

"No Amount of Sympathy, Harshness, or Force, Will Accomplish the Impossible."

fine ear for music and so knew that the blamed thing wasn't getting the gas. I looked into the tank and found that the life fluid was within an inch of the top. So I just KNEW that the old engine was mistaken. I cranked my collar into a shapeless mass of linen, I cranked four big blisters into my hands, and I worked my arm muscles until they quit work entirely, but aside

Digitized by Google

from an occasional splutter from the engine my work was futile.

With the going down of the sun, my girl hit the trail for home, leaving me to wrestle, unprotected, with the demon. I will say that I was glad in a way, I could vent my feelings somewhat, as I did, and get a chance to cool off.

After I had eased my soul of a few temporarily coined choice phrases, I began to work my think-tank. Eventually, I did just what I told you to do, a few paragraphs back; opened the pet-cock beneath the carburetor. The gasoline that came out of it wouldn't have been sufficient to have cleaned the kid gloves of a gnat.

Little baby brother was full of cute little tricks. He had poured about two quarts of sand into the tank and it took me about three hours to get it out and cost me about three gallons of gasoline. So, I warn you, don't bother to look into the tank, appearances are often deceptive. Generally you can tell whether there is fuel in the carburetor by removing the float valve cover, and noting whether there is any gas in the valve chamber or not.

To go back to our theme. Suppose you are in a refractory machine that is being prodded along by means of a magneto and find that "she won't go," just because the ignition system is minus the necessary incentive. Always look at the breaker points the very first thing, just as you did in the single coil system. Then examine the secondary connections. See that the oil and grease hasn't short-circuited any of the inside connections.

High tension current is just like an American doughboy when the war is over, it takes the shortest trail back home. See that all connections are tight and that none of the wires are broken or short-circuited. Electricity, of the low tension kind, that which runs in the primary circuit from the battery, will not jump across any gap, no matter how small.

It was my pleasure, for a time during last summer, to teach numerous classes in an automobile school. In one of the lessons, the students were supposed to find trouble. All of the instructors were in the habit of passing out a wire that had a break inside the covering; that is, the wire was broken, but the break did not show through the insulation. No student, who leaves that school will forget his perplexity over the seeming perverseness of an innocent piece of wire. On the road a wire often breaks inside the insulation. If the break occurs in a secondary wire, it matters little. But if it occurs in a primary circuit, its "ta, ta, boys, I've quit."

Now that we are on the subject of poor or broken primary connections, let me recall another peculiar reason "why she stops," or more correctly, "why don't she go?"

A short time ago, one of my friends (all of the subscribers to this magazine are my friends), requested a wiring diagram, which I gave him. Shortly thereafter, he called at the house, fortunately he lived near me, and propounded the question: "Why doesn't the dern thing run when the wires are all connected properly, all new wires, all good wires, everything just as it was when it came from the factory, except for a new switch?"

Long and thoughtfully, I gazed at that car, I talked to her gently and harshly, and finally she answered my question by telling me to scrape off the lacquer and paint from the new switch so that it would ground against the dash. I did—she did, and ran happily ever after.

A wire may be grounded to the switch, but if the switch is not connected to the dash, or the dash not grounded to the frame, or the frame grounded to the ignition unit, the electrical path is not complete.

Leading to a high tension magneto there is but one wire, besides those to the plugs, and this wire is used solely to ground the magneto current, in order to stop the engine. In one instance, to my knowledge, a driver was sorely puzzled because he couldn't stop his engine. He grounded the wire, but the engine kept right on and so, finally, he had to throw in high speed and stall the thing. When he overhauled the car, he had placed a piece of heavy paper between the magneto and the bracket upon which it rested. He had used old rusty washers upon the bolts, which also were badly corroded, consequently the magneto was fairly well insulated from the engine, so much so that he had trouble in starting, for the secondary current had to leap through the paper to the ground before the plugs would spark.

Before I end this article I want to mention the Ford ignition system. Now don't raise your eyebrows in superior disdain, even if you don't own a fliv, some of the readers may have one, hidden in a secret place—a skeleton in the closet, as it were.

Two husky roustabouts with plenty of nerve and muscle can test out the ignition system on a Ford, using the magneto as a source of current. One of them would remove all the spark plugs and spin the engine, while the other would attach a wire to the frame or base of the engine and use it as a test point.

Personally, I prefer a set of batteries in testing. Usually, I ground to the frame, one of the battery wires, then use the other as a test point. Aside from the fact that I use a battery, the tests made are the same. You can use either method you choose. Blisters and a wilted collar on the one hand and comfort and science on the other.

Before I describe the tests, let me outline the circuit. Let us first assume that the timer brush (the little roller inside the timer) is resting against the segment or terminal which is connected with number one coil.

When the switch is on current can pass from the magneto to the magneto post on the dash, into the coil box to the mag. contact of the switch, thence across the switch bar to the top and through a connection to the long bar at the bottom of the coil box. From this common terminal, the current will pass through the coil to one of the vibrator points, then to the other point and down to the little button terminal at the front of the

Digitized by Google

coil. Against this little button rests a spring which is connected to one of the posts in the dashboard. Since this post, in number one coil, is connected with number one timer contact, the current passes through this contact to the ground and back to the magneto again, completing the circuit.

As the timer brush or roll passes to the next segment, the current ceases to pass through number one coil and passes through number two coil. So it goes, through each coil, according to the way in which they are connected with the timer.

Now we have connected one pole of our storage battery, or dry battery, as the case may be, with the frame and so, if we touch the test point to one of the timer wires (after removing it from the timer), the current should pass through that coil and cause it to buzz. We can work back through the circuit, and find any break in it by noticing whether or not we get a spark when we touch the test point to a wire or terminal.

Assume, for instance, that there were a broken wire in the coil itself. We would touch the test point to the timer wire which we had disconnected. We would get no spark. We would then touch it to the dash connection; then to the vibrator, still no spark. We would next remove the coil and touch the bar at the bottom of the coil box and would find that we could get quite a little fire from it. This would show that trouble exists in the coil itself and to verify the fact we would test the coil by itself. We would touch the two wires from the battery to the coil. One wire to the bottom of the coil, the other to the primary terminal at the front of the coil.

Now if we had chosen the blister and wilted collar method and had persuaded a friend to churn the hand crank like an ice cream freezer we would have proceeded as follows: We would have connected timer wire number one with the frame, disconnected the magneto wire at the dash, removed the cover of the switch and touched the switch bar. No buzz, no spark. Then we would have skipped to the vibrator side of the coil and would have found that our test wire showed life. We would have removed coil number two or three and touched the common bar at the bottom of the box and getting no result would have decided, as we already have, that the coil itself was to blame.

* * *

And so our story ends, right where in real life the story begins—with a Ford car. The most abused machine on the market, the butt of ridicule, the subject of all automobile jokes and sarcasm, but the one car that usually limps home, after a fashion, no matter whether it has been in a train wreck or forced to carry a pair of newly weds; no matter whether it has been climbing a mountain or crossing a desert of mud and sand. The one car that always answers all rude remarks with its cheerful "putt, putt."

EXPORTS OF AUTOMOBILES AND COMMERCIAL CARS FROM THE UNITED STATES.

Detailed figures supplied to the National Automobile Chamber of Commerce by the Bureau of Foreign and Domestic Commerce, show that for the year ending June 30, the total number of automobiles and motor trucks exported, not including cars and trucks shipped abroad for use of the American Expeditionary Forces, was less than in the fiscal years ending June 30, 1916 and 1917, but materially greater than in 1915 or any preceding year.

The record for the last six years is as follows:

	Commercial Cars		Passenger Cars	
Fiscal Year	No.	Value	No.	Value
1913	993	$1,737,141	24,293	$24,275,793
1914	784	1,181,611	28,306	25,392,963
1915	13,996	39,140,682	23,880	21,113,953
1916	21,269	56,805,548	56,234	40,660,263
1917	15,977	42,343,502	64,808	48,612,632
1918	12,200	31,874,459	52,312	45,331,366

Total valuation of passenger and commercial car exports during the last fiscal year, despite war conditions, was $77,205,825, compared with $90,956,134 in the twelve months ended June 30, 1917; $97,465,811 in 1916; $60,-254,635 in 1915, and $26,574,574 in 1914, the last pre-war year.

Aside from England and France, whose purchases were mainly for war purposes, the best markets for passenger cars and trucks were: Canada, $11,571,417; Cuba, $4,160,795; Chile, $3,859,149; Australia, $3,573,962; Argentina, $2,717,022, and Japan, $2,358,684; European Russia, $2,698,703; Mexico, $2,179,209; British South Africa, $1,813,221; New Zealand, $1,599,075; Philippine Islands, $1,588,310; Dutch East Indies, $1,465,549, and Spain, $1,444,736.

NEBRASKA LEADS THE COUNTRY.

Nebraska's name leads all the rest in the number of automobiles per capita, that opulent commonwealth having a car for every eight inhabitants. Moreover, the West is so far ahead of the East and South that the latter can hardly be expected to take any interest in the figures.

Even the District of Columbia, where there is popularly supposed to be such a congestion of cars as to have made it necessary for certain boards to move to Philadelphia, is eighth in the list.

Digitized by Google

The leading Eastern State is Maine, which ranks twenty-first. Doubtless it is the ubiquitous tractor that accounts for this arrangement. But who would have thought that under any circumstances Montana would have more automobiles in proportion to population than Kansas, or Arizona than Ohio?

States lying side by side are far apart in this respect. Colorado has an automobile for every dozen persons within her borders, while in Utah every car must serve almost twice as many.

New York, with the pleasure cars of the largest city in the country and an up-State with farming communities, might be considered to have a good chance for a place high in the list, but it is thirty-third, being preceded by New Jersey and followed by Oklahoma. In absolute number of automobiles it is first, with 434,000.

Pennsylvania is the only other Eastern State with more than 300,000, and it is led by Ohio and Illinois, while California and Iowa also boast that number.

The figures, compiled by the Bureau of Publicity of the Omaha Chamber of Commerce, would be still more interesting if they were analyzed to show the relative number of pleasure vehicles and tractors in the several States.—Evening Post.

The Neglected Opportunity

The Owner Of An Accessory Store Is a Back Number If He Is Not Willing To Put Up a Good Window Display.

BY FRANKLIN MYERS

CONFIDENCE born of positive knowledge of conditions makes the "Johnny-on-the-spot" kind of a man. We're getting back to business by leaps and bounds—so stiffen the fibers of your business sense—clarify your gray matter. Overhaul that faded and haphazard window exhibit—be "Johnny-on-the-spot" like our boys over there—work the way they fought.

The best window display is the one that is most striking and done at the least cost. I have seen displays that cost anywhere from twenty-five to fifty dollars that were an absolute disappointment so far as money return is concerned. Spending a lot of money on the display is the very first thing the retailer must get out of his head. The real, good, successful, money-winning display is the one that the retailer and his clerks can make themselves. It is a business proposition pure and simple, and should not cost more than just a few dollars, so that a very good profit over and above all expenditure is assured.

To awake in the observer a desire for possession, is the mission of the window trim. If it does not do that, it is a failure, be it ever so attractive in arrangement and color scheme.

There are many displays pleasing to the eyes but which, when analyzed, are found wanting in the quality of selling force. That is the point around which skill in producing impressive display should be applied. A frank, simple and practical trim is more convincing than the freakish variety. Every detail of every display should be worked out with deliberation, and care taken at all times to have the window reflect the true character of the establishment.

The plain marking of every article is imperative at any time, but more especially so when many extra salespeople are employed. The price ticket is a powerful aid in retailing goods. Many sales are lost because the price is not marked on articles, and it is wonderful how neglectful in this respect even large stores are liable to become. When the price is plainly marked many customers will wait upon themselves up to the point where the checking of articles comes in.

There are stores and stores. There are "grouchy" stores and "smiling" stores. There are flippant stores and dignified stores. And the peculiar thing about each is that the goods or the prices have little to do with the store's temperament.

It is the personality of the store that colors and defines the character of the goods from the customer's viewpoint and wins or repels approval. Thus we see that a store is almost human.

In the long run, service is what you pay, always. The goods as goods alone, are incidental. Service implies quality, fair prices, safe treatment and honesty in every detail of every transaction.

It is the duty of the sales clerk—a most important duty—to inform the manager immediately when certain portions of the stock are running low. Nowadays it's almost criminal for a store to actually run out a product through any cause—that is, providing no very great special rush has been made on that one particular article—even then there's hardly any excuse unless the manufacturer happens to be stuck for material.

Here's another pointer for the clerk—the words "Haven't got it" ought to be shunned—they ought to be forgotten—never to be resurrected—they are not part of a salesperson's vocabulary.

Imagine yourself an accessory store owner; seeing a customer approach a clerk—and then have the clerk spill out "Haven't got it."

In the name of common sense, show the merchandise you have—tell a bit about it—explain the merits of the goods to the customer, with the remark that it is the nearest we have to what is called for.

Digitized by Google

The idea, of course, is to sell merchandise; but whether it is sold or not, leave a good impression, make the customer feel as though you are interested, have him understand that you're glad to show merchandise. Preference is given the salespeople who are accommodating.

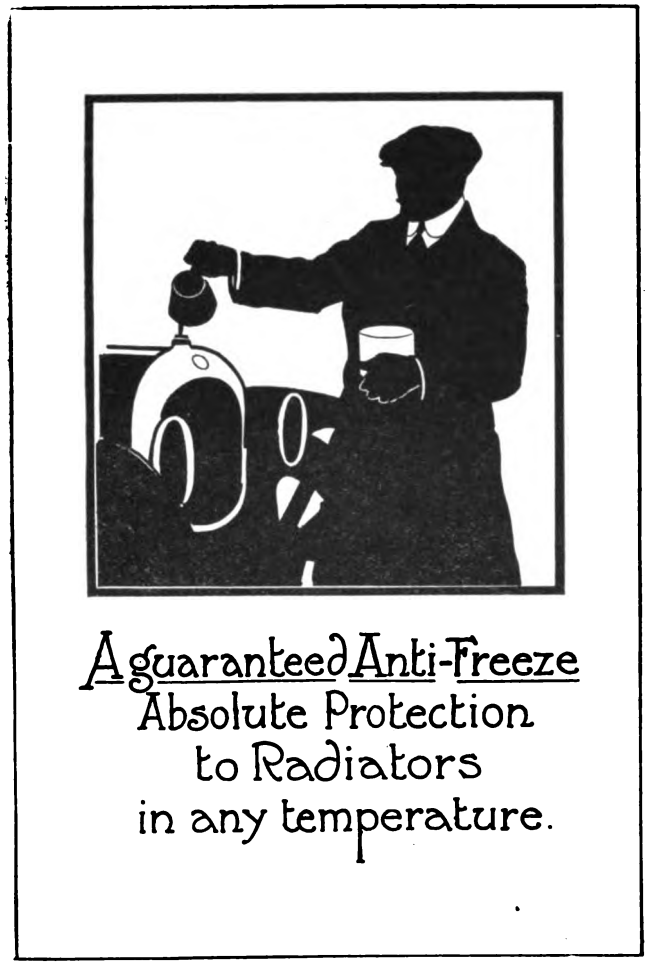
The merchandise you're selling is GOOD merchandisc—well worth it's price. Show it, explain it. And forget "I haven't got it."

Be Johnny-on-the-Spot!

Any advantage to be gained by superior methods is indispensable to complete success. Your store windows must be counted as just so much advertising space—to be filled with live matter the same as advertising space in a newspaper and just as valuable. Captions and headlines are used in the show window in the same manner and for the same purpose as used in the newspaper—to call attention to what you have to sell.

This statement is so simple it almost seems childish—yet, within a stone's throw from where I sit writing there are at least ten good sized stores on the main thoroughfare that resemble neglected gardens—choked with weeds and stubble. The big auto accessory store on the corner has not had a change of window display in five weeks—many of the plain uninteresting show cards are curled up and dust has settled on the miserable exhibit.

I know the man—he's lazy and his help are doing all in their power to be just like the boss. You very seldom notice anyone looking in the windows of that store. That man is losing hundreds of dollars every week, but he doesn't know it. He is in possession of the best location on the block or in the neighborhood and is keeping some good live man out of a fortune.



He is a "puddenhead"—call him anything you like, he'll think he is "some pumpkins" just the same. He secured the store some years ago and the neighborhood grew up around him. To my knowledge he has never done a single thing to encourage trade. Years ago the man who sold the store to this "Mr. Pumpkins" was even slower than Mr. P.

A Poster Window Background to Be Done in Purple and White. See Your Sign Man About It—Show Him This Illustration.

Digitized by Google

The landlord was brighter than either—he wanted to get more rent out of the place so he put in new and larger show windows. "Mr. Pumpkins" made a howl because the landlord had designs on the contents of his wallet—which I guess if the truth was known, wasn't very heavily plastered with long green. Business of course just naturally picked up and "old Pumpkins" began to swell up in the region of the chest and occasionally shot forth advice on how to improve your business.

Did you ever notice that it is just this kind of men that have money thrown at their heads—at times? No! It wasn't luck at all—it was good business ability on the part of the landlord—if "Mr. Pumpkins" had been given his say—he would be in the old original dingy store yet.

A great many people often argue that there is a lot of luck in business! Maybe there is, but it doesn't come to the man who sits in his private office and waits for it to visit his store. If there is really luck in getting trade, it has to be dug out and captured and held fast.

In this case it was the landlord who did the digging.

Many a man just misses being a success through his persistence in pursuing business policies or personal characteristics which keep him in the ranks of the unsuccessful. He believes that he is doing all in his power to progress, but something is wrong, some cog is misplaced, or has sand where oil ought to be, and the man is ignorant of the basic wrong.

A searching self-analysis is in order. The outside viewpoint must be gained. Possibly a rank outsider who is capable of intelligent criticism can locate the wrong. Again, the man himself may be able to assume an entirely disinterested attitude and so give himself or his business a thorough "up and down" that will allow for readjustment along successful lines.

So far as "Old Pumpkins" is concerned—he couldn't take more of a disinterested attitude if he tried—but he can't see anything—either coming or going. "There's nobody home" in the top story. What are you going to do with a store keeper like that? He's got the location and manages to hold on to it—somehow or other—no one knows—sometimes I think he must have married in the landlord's family—it has been just his "luck" to get a smart helpmate.

But listen and I'll tell you the rest of the story. Just one block away another big store has started up—"Old Pumpkins" is beginning to take on a worried look. The New Store is right up to *now*—it is a bright, clean, sociable store. The show windows reflect the enthusiasm and energetic efforts of some professional who knows his business.

I go into the store often to see how progress works out. The windows contain Pictorial Display Cards—plenty of them—and they are pulling like the big home-made porous plaster mother used to make.

The store is crowded all the time—the cash registers are singing all day long that delightful ballad entitled, "O, see the 'cash' flow in."

Anyhow "Old Pumpkins" has at last met his Waterloo—he is getting it where the chicken got what little George Washington sampled his father's cherry tree with—so to speak. He says he's going to move to Hoboken—see? He's a quitter—he always was a quitter but it didn't show up until he had a good excuse.

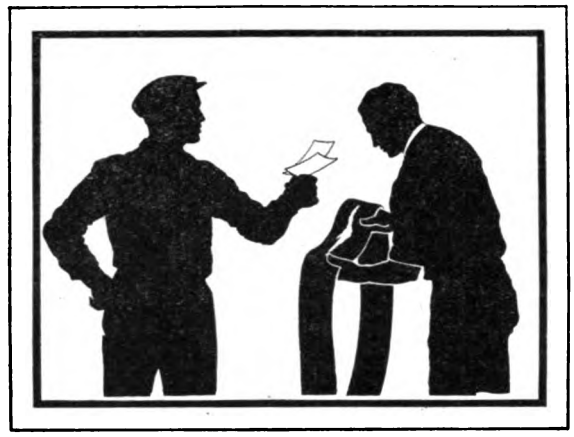
The Silhouette Display Card.

It is strange that more silhouette cutouts are not used on signs—surely there must be a screw loose somewhere—and it was just through this kind of thinking that the writer set out to find that screw and tighten it up.

It goes without saying that when a thing can be done in a simple way, that is, when some really good, meritorious sign scheme can be worked out easily so that a very satisfactory result is quickly obtained, its popularity is easily assured. The writer has observed sign men either drawing or tracing pictures on black paper and then with much difficulty endeavor to cut out the pictures. It's rather a long-winded operation and has been avoided particularly by the store clerk because of the bothersome preparatory detail and the cutting which, so to speak, is done in the dark, as the paper being black does not show the outlines of the picture clearly enough for rapid cutting.

The consequence is, the clerk, after one such experience, generally finds some excuse for not following up what is really one of the most striking and attractive

Digitized by Google



styles known to the professional sign writer. Of course, the layman or the clerk cannot be blamed for dropping, like a hot potato, anything in the way of a sign that is going to eat up too much of his already well-filled time, but instead of dropping a thing on first trial right away, why not in spare moments think up some easy way of getting the desired result?

Here is an easy way of obtaining the silhouette without as much as touching a pencil. Go through your old magazines and select such pictures as give a side view—the kind of pictures that display well when cut out.

Different positions of figures will often suggest to you certain words or catch phrases for lettering use on the sign. Cut out all these pictures that you think suitable for this purpose, using a small pair of scissors, except on inside cutting, which is better accomplished with the penknife.

Get a tube of ivory black or lamp black water color, and mix it well in a small dish with an ordinary No. 5 sable brush, paint over the cutouts in jet black; when dry, paste them down on the card, leaving enough space for the lettering. This explanation tightens up the loose screw and shows the reader just how very simple this silhouette process is when it has been properly thought out.

Your pictures are already drawn for you, there is no bother cutting into black paper because there is no black to contend with while cutting is under way, all the black being put on afterward. Simple, isn't it? Still, there are men day in and day out throwing aside this particular sign that has the punch, just because there seemed to be no easy way of doing it.

Put on a good Patch while you're about it—one that WILL stay put—

SOMETHING NEW IN TOPS.

The West sometimes brings out something good that the East is very glad to adopt after becoming conversant with it.

On the Pacific Coast recently, they have hit upon a brand new and attractive idea in the recovering of cars having solid tops of the Victoria or semi-Victoria types.

The material used for the recovering is one of the Fabrikoid lines. It is claimed for it that it gives the car a striking elegance and individuality not possible with any other material yet tried; that it will last indefinitely on a solid top and always retain its beauty. Thousands of the finest cars on the coast are now to be seen on the streets resplendent in these new tops, the material for which comes in all solid colors and in many beautiful two color combinations exactly duplicating in grain and finish the most luxurious Moorish and Spanish leathers.

The coating on the Fabrikoid is pyroxylin, a material which does not oxidize and break down under severe atmospheric conditions as does rubber or any coating prepared with linseed oil. Because of the pyroxylin coating, a protective film is formed which will not discolor, fade, turn gray or hold dust. It is absolutely waterproof and can be washed like glass or china with plain soap and water.

EASTERN CANADA'S SHOW.

The National Motor Show for Eastern Canada for 1919 will be held in the Victoria Rink, Stanley and Drummond Streets, Montreal, from Saturday, April 5th to 12th, inclusive, and the exhibits will include Passenger and Commercial Cars, Motorcycles, Motor Boats, Aeroplanes, Accessories, Tractors and Farm Lighting outfits.

The decorations will be in the form of a huge Japanese garden which will have a very pleasing effect, as in addition to a large quantity of Southern smilax, natural shrubbery and foliage will be used with flags of all nations. The lighting arrangements will include five thousand eight candle-power lamps, carbon, tungsten and nitrogen lamps.

The show will be run in aid of the Montreal Soldiers Wives' League, and a very elaborate and well organized ticket selling campaign is being arranged by the various ladies' committees. These tickets will be placed on sale throughout the city, and it is expected that a tremendous number will be sold.

A special section of the show will be placed at the disposal of exhibitors showing motor boats, and application has already been received to exhibit a 27-foot motor boat. Mr. T. C. Kirby is now busily engaged in allotting space and attending to the thousands of details in connection with a huge exhibition of this kind.

REMOVING CARBON.

The use of kerosene is often advocated as a means of removing carbon. This liquid must be used in conjunction with a certain amount of water, or the remedy will be worse than the disease. After the engine has been started and fully heated, pour about a teaspoonful of kerosene into the carburetor air intake, then pour in a like amount of water. Alternate the kerosene and water until about a half a teacupful of each has been used.

Steering Gear and Linkages

The Car Owner Should Make Regular Examinations of the Steering Gear—His Safety Depends Upon It

BY F. L. ALMY

NO part of the car receives so little attention as the steering gear, yet it is really the most important device on the car. The steering assembly in the modern car consists of a number of parts which are illustrated in Figure 1.

At A is shown the steering wheel; B the steering column; C the steering gear, which embraces all the steering reduction gearing, or similar devices; D shows the drag link which connects the Pitman arm, H, with the projection on the steering knuckle, G.

Passing through the steering knuckle, G, is a pin termed the "king pin," or sometimes the "king bolt." There is a similar bolt at the opposite end of the axle for the left steering knuckle. Both steering knuckles are connected by a tie-rod, E. This arrangement permits the wheels to turn upon the wheel spindles without swinging the whole front axle, F, as in a wagon.

At the present time we are concerned particularly with the unit C, termed the steering gear, which transforms the circular motion of the steering wheel, A, into lateral or back and forth motion of the Pitman arm, H. In the older types of machines a long lever, extending up to the driver's seat, connected with the tie-rod and permitted the driver to move the wheels in the various directions. However, should one of the wheels strike an obstruction in the road, there was danger that the steering arm would be jerked out of the hands of the driver and the car run wild.

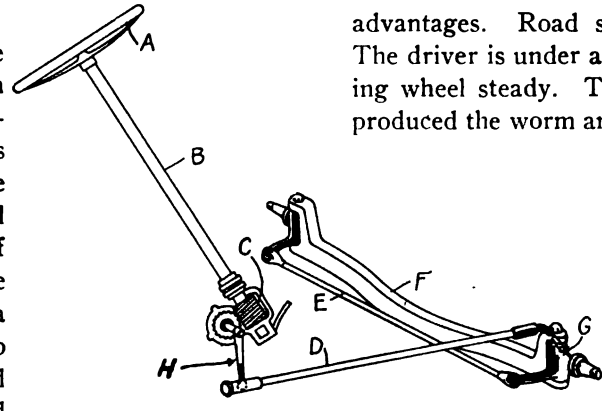

Fig. 1—Showing Parts of the Steering System.

To prevent this, the steering gear C was devised. It is nothing more or less than a means of power reduction. The older type is called the gear and quadrant and is shown in Figure 2. A indicates the steering column upon which is mounted a bevel pinion steering gear, B, which meshes with a quadrant or quarter gear C. As A is turned, through the steering wheel, the quadrant is rocked back and forth, and since the Pitman arm, D, is connected directly with the quadrant forging, the drag-link is moved back and forward as required, steering the car.

One can see that this type of steering gear has its disadvantages. Road shocks are not entirely eliminated. The driver is under a strain at all times to keep the steering wheel steady. To eliminate this backlash, designers produced the worm and sector type of steering mechanism shown in Figure 3 at B.

In this diagram C indicates the steering column upon which is mounted the worm E. The worm meshes with the sector, that is, a section of a worm wheel, as shown at F, and this sector carries upon it the Pitman arm G.

Digitized by Google

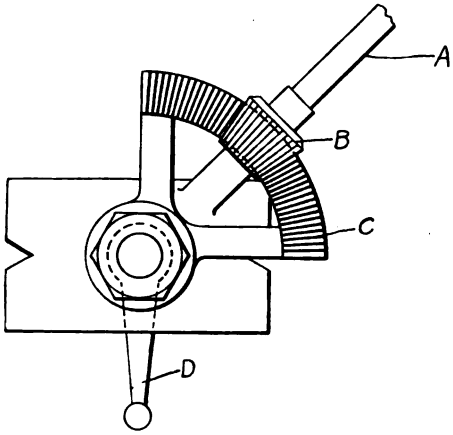

Fig. 2—Gear and Quadrant Type of Steering Gear.

In this case it is easy enough to turn the steering wheel; the steering wheel turns the worm through the shaft and the sector F is moved back and forth. On both sides of the worm, and illustrated at D, are usually mounted a pair of ball thrust bearings, though in some cases simply a bronze washer is used. Continued use of this type of steering gear naturally would result in a certain amount of wear. The wear comes usually upon the sector F, and as there is no way to prevent this, after a time it will become necessary to replace F.

To obviate this, and to increase the life of the device, engineers evolved the worm and wheel type of steering gear shown at A in the same sketch. In action this device is the same as the one shown at B, except that the full wheel F replaces the quarter wheel or quadrant in the first type. When one-quarter of the gear F becomes worn, the Pitman arm G can be removed, the gear given one-quarter of a turn and the Pitman arm G replaced. This is practically a replacement of the worn portion with a new section, and is one means of adjustment of this gear.

End play in the steering column C can be taken up by screwing down the large nut at the top of the gear assembly. This nut presses against the bearing D and compensates for any lost motion or wear in the bearings. In some types of steering gears this nut may be found at the bottom of the gear. In the higher priced cars a more complicated steering gear is adopted. This gear is termed the "sliding block" type, and consists of the parts

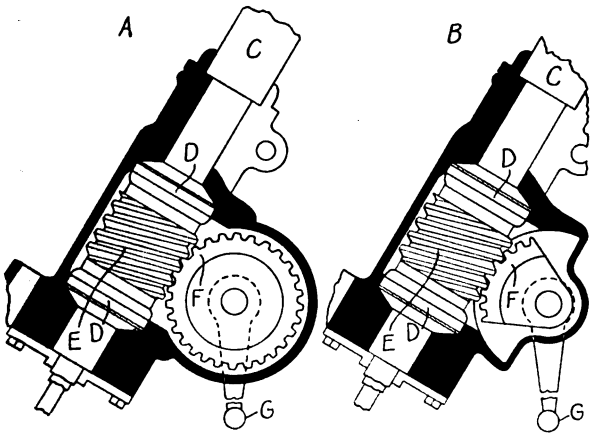

Fig. 3—Worm and Wheel, and Worm and Sector Types of Steering Gears.

shown in Figure 4. An assemble sketch is also reproduced in the same figure.

Upon the steering column B is mounted the double worm A. By a double worm we mean a worm that is cut with both a left and a right-hand thread. Two blocks, C and D, are fitted with teeth, one block has left-hand teeth fitted upon it, the other has right-hand teeth. As the steering column B is turned towards the right, the block D will travel upward on the worm, while the block C will travel downward. Each of these blocks rests against a roller, F, upon the peculiar shaped piece J. At one end of J is mounted the shaft G, and upon it the Pitman arm K.

As the blocks travel upward and downward, J is twisted to the left or to the right and the Pitman arm moved forward or backward, steering the gear. The general method of adjusting this device is similar to that adopted in adjusting the steering gears shown in Figure 3.

The steering gear on the Ford car is of an entirely dif-

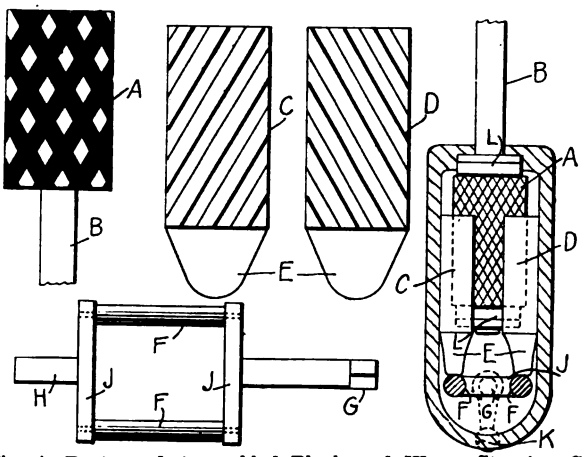

Fig. 4—Parts and Assembled Block and Worm Steering Gear.

ferent type from any of those described. Instead of being located at the lower end of the steering column, it is located directly beneath the steering wheel. The lower end of the steering column is fitted with the Pitman arm and the gear reduction is had by the device illustrated in Figure 5. The housing for the steering column is fastened to the dashboard. This housing, C, is fitted inside with an internal gear. To the upper end of the steering column is fastened the forging E, upon which are mounted three studs, and upon these three studs are mounted, free to move, three small gears, two of which are shown at G and at D. The center gear J is fastened directly to the steering wheel. As this gear is turned, then the small gears, G and D, are revolved. They form small levers which twist the forging E around and so turn the steering column.

Steering Linkage.

Next in importance to the steering gear come the fittings at the steering knuckle. It is very important that this portion of the car be kept in good condition, for should the king-pin break, an accident surely results. Since all of the pressure and shocks of the road go through this pin, the wear at this point is excessive. Every car that comes into your shop should be examined at this point. The front of the car should be jacked

Digitized by Google

from its wheels, and if there is any play in the steering knuckle, new parts should be put into place. Usually the steering knuckle forging is bushed with a bronze sleeve, though in a few expensive cars ball bearings are provided at this point.

We have made comparisons with the bicycle of olden days; let us go back a minute and learn another lesson from it. If you ever tried to reverse the front wheel—that is, turn the forks in the other direction—you know how hard it was to steer the bicycle. As a matter of fact, it was almost impossible to steer the wheel at all if the forks were wrong side foremost.

The same thing is true about the front axle of an automobile. The king-pin slants backward at the top slightly. Very frequently an automobile will be brought into your shop for repairs. The owner will claim that

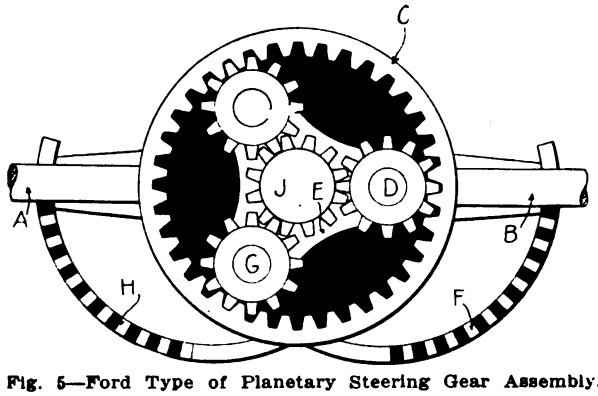

Fig. 5—Ford Type of Planetary Steering Gear Assembly.

he has great difficulty in steering it. Always examine the front axle and see that the steering knuckle and king-pin slant backward slightly. The axle may be bent or it may be that the springs have slipped just enough to tip the axle slightly. At any rate, once you know about the trouble, it is easy enough to repair it.

EXCESSIVE LUBRICATION IN V TYPE ENGINES

As a means for preventing excessive lubrication and oil leakage into the explosion chambers of the right hand block of V type engines, a baffle plate has been suggested.

If the oil dippers on the ends of the connecting rods are cut down, there is danger of cutting off the lubrication from the left side of the engine.

Directly beneath the path of the piston, at its lowest point, screw or bolt a large tin, washer-shaped plate, slotted to give clearance for the connecting rod. This plate will eliminate much of the direct splash from the connecting rod dippers, but will not prevent the entrance of oil vapor into the cylinder chamber.

At the lowest point of this plate, two or three small holes should be drilled. These holes will act as drains for the surplus oil, condensed in the cylinders and pistons.

When the plates are in place, the cylinder, inside, will resemble a closed tin can, with a slot at the bottom (in the plate) for the connecting rod.

RAISE IN SUBSCRIPTION RATES.

CONSTANTLY advancing costs have forced us to consider seriously an increase in the subscription price of the Automobile Dealer and Repairer.

Of course it is well known to most readers that white paper, printing, binding, postage, in fact everything connected with the publication of a journal like ours has gone up in some cases more than one hundred per cent. It costs us now very nearly if not quite twice as much to produce our magazine as it did before the war.

In view of these circumstances we believe our readers will feel that we are fully justified in raising our rate to $1.50 a year, to take effect April 15th next. This new rate will apply to all of the United States except zones seven and eight, comprising the following States: Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, South Dakota, Oklahoma, Oregon, Utah, Washington, Wyoming. In these two zones (seven and eight) we are compelled to make the rate $2.00 a year owing to the exorbitant postage called for by the new law.

In view of the great amount of valuable information which the Automobile Dealer and Repairer furnishes each year, the increase in cost to each subscriber of 50 cents will, we feel sure, not be considered a hardship and the increase in our income will enable us to improve our journal from time to time and make it well worth the additional 50 cents which we are compelled to charge.

We have been encouraged in the matter of raising rates by numerous letters received from subscribers to the effect that if we were forced to raise, they would cheerfully pay the advanced rate. A letter recently received from Dr. R. T. Greer, of Mississippi, is especially reassuring. He says, "Enclosed you will find check for renewal of my subscription to the Automobile Dealer and Repairer. When you raise the price to $1.50, I shall still stay with you. When you get to $5.00 per year my name will continue on your mailing list. I would not be without your journal under any circumstances. Raise your price as the journal is worth the money. I am willing to bet that you will not lose a single subscriber."

By postponing the date of the raise to April 15th, we give our old subscribers (as we think is only fair), a chance to renew their subscription at the old rate. Those who have recently renewed can have their subscriptions extended for a year longer by sending a dollar for that purpose.

Each present subscriber will be permitted to recommend two friends of his (whom he thinks may be benefited by reading the Automobile Dealer and Repairer) as subscribers and we will give them the advantage of the old rate of a dollar a year. In sending these subscriptions with remittance each subscriber who takes advantage of this offer is requested to call attention to this offer.

Reading a Micrometer Caliper

The Mechanic of the Present Day Must Be Able to Measure Within a Ten Thousandth Part of an Inch

BY R. W. SMITH

IN the old days a workman who could work within a limit of error of one-sixty-fourth of an inch was considered, no doubt, as extremely capable. And so doubtless he was. For this is pretty nearly all he could be expected to do with the means of measurement at hand. So long as all that was required was to fit one part to another, also on the spot, good work could be done.

But with multiplication of machinery over the breadth of a great continent, the need for the prompt and accurate replacement of a worn-out part became imperative. This

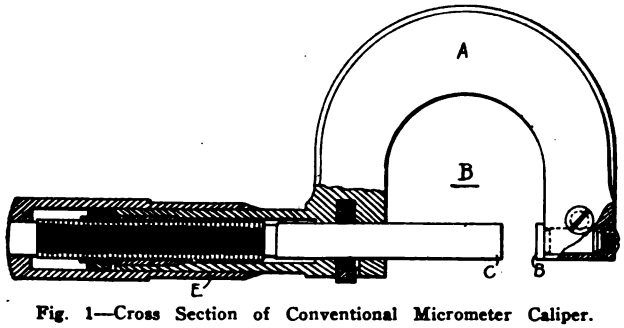

Fig. 1—Cross Section of Conventional Micrometer Caliper.

could not be done unless the original machine had had its parts machined very closely to standard. Further, in the procees of assembling at the manufactory, if many duplicate machines were being built, it became an intolerable nuisance to get a set of parts that would not fit together.

So, for their own immediate benefit and also for the benefit of their customers, those who manufactured large quantities of duplicate machines were driven to make up the many parts within an exceedingly small error. The limit of 1/64 inch became out of the question. The micrometric measuring tools are the answer to this demand, and it is now quite practicable to measure within the limit of .0001 of an inch.

The Pitch of the Micrometer.

The essential idea which underlies the micrometer screw is the fact that the advance which a screw makes in a nut in a single revolution is precisely the length of the pitch, and that it is possible to measure small fractions of this advance in corresponding fractions of a complete revolution. To fix our ideas, suppose the screw and its nut have exactly 100 threads to the inch.

If the nut is held stationary and the screw turned exactly one revolution, then the screw will have advanced precisely the longitudinal distance between the adjacent threads—bottom to bottom of thread, or top to top. This distance is exactly .01 of an inch. Now if we make a half-turn, the advance is one-half the pitch, or .005 inch. Or, suppose we are able to determine when we have turned the screw .1 of a turn (36°). The advance then would be just .001 inch (.1 × .01 = .001).

Now in the ordinary micrometer calipers the screw is usually cut with 40 threads to the inch. Each turn consequently advances it in its nut 1/40 inch. To measure .001 inch we must determine when we make 1/25 turn, for the reason that 1/25 × 1/40 = 1/1000.

Consider now the partial sectional view of a typical micrometer caliper, the section passing through the axis of the screw, as shown in Fig. 1. The frame or body of the caliper is shown at A. A hardened steel piece, B, is set in on one side and forms what is termed the anvil. Engaging with the thread of a nut arranged in the opposite side of the frame is the micrometer screw. This screw is part of the spindle, C. The nut is essentially a part of the frame, A. The part which incloses the screw is the barrel. There is a metal shell, E, termed the thimble, which envelops the barrel. It operates, however, in unison with the spindle. If it is turned, the spindle is turned.

The caliper consists, essentially, of two parts—one fixed, the other movable. The barrel, frame and anvil constitute the fixed portion. The spindle and the thimble make up the movable part. The movable part has two movements relative to the fixed portion—a linear and a rotary motion. A moment's consideration will show that we can arrange a scale on the barrel which will enable us to tell, roughly, just how much the thimble advances or recedes. This we do by noting the position

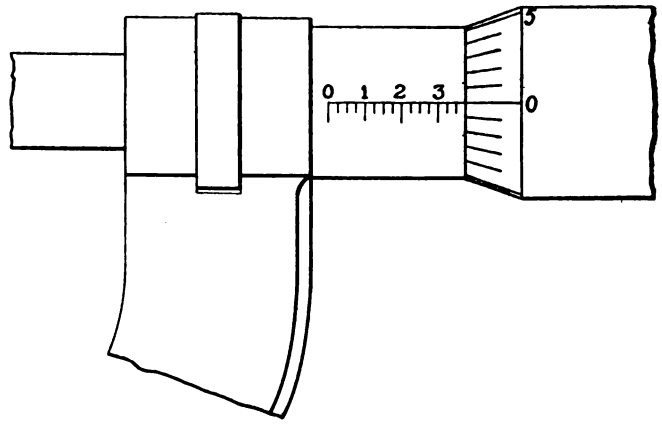

Fig. 2—Caliper Opened Just .375 of an Inch.

of the inner end of the thimble. This is beveled off to a thin edge and so permits this to be done with ease.

Meaning of the Divisions.

Each little subdivision of the scale is 1/40 of an inch, and consequently corresponds to one complete turn of

Digitized by Google

the screw. Four such subdivisions amount to 1/10 of an inch and constitute a principal division of the scale. If the scale is one inch long, there are thus 10 such principal divisions. It will now be seen that every turn of the spindle means that it has advanced on the anvil or receded from it exactly 1/40 of an inch—or one subdivision. Each subdivision then corresponds to an opening or closing of .025". One principal then corresponds to .100".

Let us consider a practical example. Suppose we wish to measure ⅜ inch. Expressed as a decimal this is .375 of an inch. We open the caliper, say from a position where it is entirely closed until the edge of the thimble has cleared three principal divisions. This amounts to .300". As each subdivision is .025", we continue to open out until three of them are cleared in addition. This last movement amounts to 3 × .025" = .075". The total movement is, consequently, .300" + .075" = .375". And this is the desired opening. See Fig. 3.

It is well to grasp this thoroughly, so let us take another example. Suppose we wish to open a gap between anvil and spindle of ⅝ inch. In decimals this equals .625". We observe at once that we may write .625"

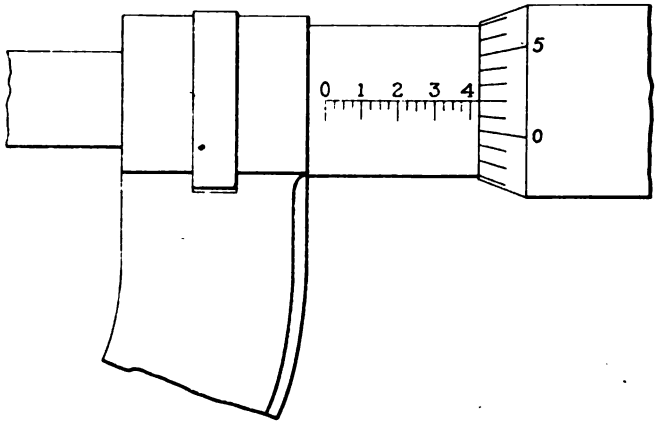

Fig. 4—Caliper Opened .427 of an Inch.

as .600" + .025". All we have to do, then, is to open out until six of the principal divisions have been cleared and, in addition, one subdivision.

But if this were all that the micrometer caliper could do, the finely chased screw would be of but little advantage. We have been depending, so far, upon the eye to determine when we have just cleared a principal division or a smaller one. A highly trained eye might, perhaps, accomplish this with considerable exactitude.

There is, however, a much better way. Suppose we make a longitudinal mark on the barrel. Let us now close up the caliper and make a mark on the bevel of the thimble to correspond with it. If now we open the caliper until the mark on the bevel again corresponds with the longitudinal mark on the barrel, we know that we have made one complete revolution. This revolution means, let us remember, a longitudinal movement of 1/40 inch, or one subdivision.

Now we can, of course, divide up the entire circuit of the bevel into any convenient number of parts—say 25. A turn of the spindle of 1/25 of a revolution would thus cause a longitudinal movement of 1/25 of 1/40 of an inch. That is, one of the little divisions on the bevel corresponds to .001 inch. We are now making use of the rotary movement between the two sections of our caliper. In fact, the 25 subdivisions on the bevel enable us to do what is equivalent to dividing up each 1/40 inch on the barrel into 25 equal parts.

Let us gather up our results somewhat. Each principal division on the *barrel* amounts to .100". Each subdivision on the *barrel* amounts to .025". And each subdivision on the *thimble* amounts to .001". Now, of course, we should have figures placed on our two scales—one of which is on the barrel, and the other on the thimble—to save ourselves the trouble of counting The scale on the barrel is given a number for each of the principal divisions.

The scale on the thimble is numbered at every fifth subdivision. See Fig. 3. Now one important thing to remember is that these two scales are really not two but one. The *whole* scale on the thimble is merely *one* of the barrel subdivisions cut up into 25 equal parts.

An Example.

Suppose now we take an example. See Fig. 4. The position of the edge of the bevel shows that the thimble has been moved out four principal divisions of the barrel scale, one subdivision, and something over. The gap in the caliper amounts, then, to .400" + .025" and something more. When the zero on the thimble just corresponded to the longitudinal line on the barrel, there was no excess over .425". But the thimble has been rotated two thimble subdivisions further. That is, the excess over .425" is .002". So that the opening between anvil and spindle is .427". Let us now consider an example of a converse character. Suppose we wish to open the caliper so as to have a gap of .368". We break this up thus:

.368" = .300" + .050" + .018".

We open the caliper, then, so as to clear three principal divisions on the *barrel* (.300"), and continue until two subdivisions are cleared (.050"), and then continue further until we have turned the *thimble* to the position where its 18th space is just below the longitudinal line on the barrel. The proper position is shown in Fig. 5.

The Vernier Scale.

However, it frequently happens when measuring that the thimble comes to rest with the long line on the barrel *between* two consecutive marks on the thimble bevel. Such a position is shown in Fig. 6. We see that the gap must be .200" + .025" plus something more. We may *guess* that this "something more" is one-half of .001" (*i. e.*, .0005"). But if we want to determine the point with a higher degree of accuracy, we may do so by means of a *vernier* scale arranged on the barrel. There is other fine measuring mechanism which employs this

Digitized by Google

device, so that it may be worth learning aside from its use on micrometer calipers.

Suppose we have a scale whose subdivisions are easily enough read, but which we want to read to *tenths* of a subdivision. We make another scale having *ten* spaces corresponding to *nine* of the original scale. See Fig. 7.

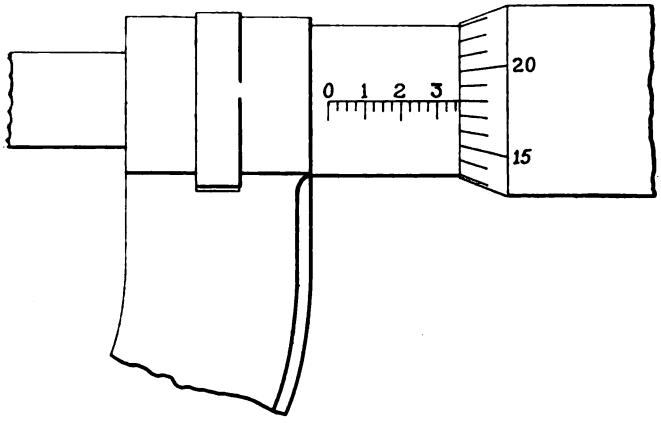

Fig. 5—Caliper Opened .368 of an Inch.

Here we have the two zeros together. If we look at the next pair of marks, the one on the vernier will, of course, be found behind the one on the other. In fact, since one vernier space is 1/10 of 9 original spaces, we see that a vernier space is equal to 9/10 of an original space. The vernier mark is, consequently, just 1/10 of an original subdivision behind. At the next pair of marks the vernier is 2/10 behind. And so on. Thus, line "6" on the vernier is 6/10 behind. Now let us see how advantage may be taken of this device on a micrometer caliper.

Refer to Fig 6. We find that the reading is somewhere between .225" and .226". Now a vernier scale is arranged circumferentially on the barrel beginning an *integral* number of *thimble spaces* above the long line on the barrel. The vernier has 10 spaces corresponding to 9 on the thimble. Now, since the vernier begins an integral number of thimble spaces above the long line on the barrel, we know at once that the zero on the vernier occupies precisely the same relative position between marks 3 and 4 on the thimble as the long line does between marks 0 and 1. What we want to know, then, is how far above the thimble mark "3" is vernier mark "0."

Now we know that as we follow the vernier round its marks will be falling back towards the thimble marks at the rate of 1/10 a thimble space each time. Consequently, when we find that mark 7 on the vernier is even with a mark on the thimble, we know that in 7 steps the vernier has lost the total amount it was ahead. This means, then, that the vernier zero is 7/10 of a thimble space ahead of thimble mark 3. Or, what is the same thing, the long line on the barrel is just 7/10 of a thimble space ahead of thimble mark 0. Now 7/10 of a thimble space corresponds to a *longitudinal spindle movement* of 7/10 of .001". This is .0007".

Reading the Vernier Scale.

In other words, we get the rule: *Find the line of the vernier which matches any line on the thimble; the number of this vernier line gives the figure for the ten-thousandth's place in the micrometer reading.* In applying this rule, we must take the smaller of the two alternative readings obtained without the vernier as the one to which we add. Thus, the readings obtained from Fig. 6 without the vernier are .225" and .226" (the true figure is between them). We have now found that we add .0007" to the small, and so we obtain, finally, .2257".

It should now be apparent that with the aid of this simple arrangement it is quite possible to read to four places of decimals with a micrometer caliper of ordinary construction. It adds about $1.00 to the price of the instrument.

Several difficulties have beset the practical use of the micrometric caliper. One of these connects itself with the changes in dimensions due to temperature variations. The difference of a single Fahrenheit degree produces a change in the linear dimensions of a bar of steel of .000006. Thus, if a piece of steel is 4 inches long, one degree will produce a change of .000024". Fifty degrees brings a change of .0012".

It is quite conceivable, then, that if the difference in temperature between work and caliper be considerable we may have errors in our readings. However, the expansion or contraction of both spindle and frame seem to compensate each other, partially at least. However, the frame of the caliper may become warm from the hand and so expand alone. To meet this difficulty, the United States Government had micrometer calipers made by one of the principal makers in which the steel skeleton

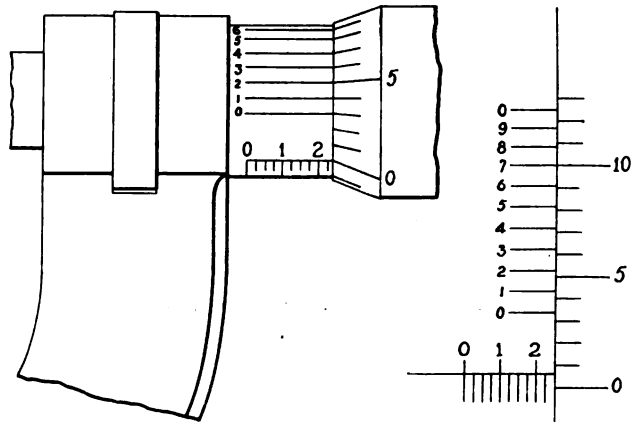

Fig. 6, At Right—Caliper Opened .2257 of an Inch. Fig. 7, At Left—Illustrates Location of Vernier Markings.

frame is covered with hard rubber, thus effecting heat insulation.

Further, the work itself may expand or contract under the influence of thermal changes. If absolute accuracy is required, work and measuring instrument should both be at the same temperature.

Another difficulty connects itself with variations in

Digitized by Google

pressure when final contact with the work is made. A little more or a little less pressure will give various readings. One workman may get a slightly different measurement from another. In fact, the *same* workman may get two or more readings owing to variations in pressure. With the powerful 40-thread screw there is no trouble to strain the parts slightly or perhaps to compress the work. This difficulty has been very well solved by the use of a ratchet stop.

When the final turn is about to be made, the workman

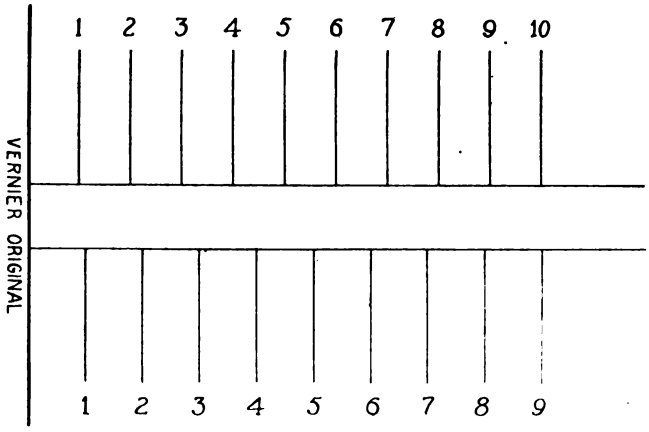

Fig. 8—Showing Divisions on Vernier Scale as Compared With Those on Thimble.

releases his grasp of the thimble itself and takes the ratchet stop between thumb and finger. This device is so arranged that it will slip when turning in the right hand direction, if the pressure exceeds a certain definite amount. Consequently, we are thus enabled to accomplish our measurements at a definite standard pressure. This appliance increases the cost of a micrometer caliper about 50 cents. Upon turning in the opposite direction, the device operates to turn the thimble without reference to the standard pressure.

A further difficulty is connected with the speed with which measurements may be made. When one reflects that the screw has 40 threads per inch, it becomes evident that to move the spindle back and forth with reference to the anvil 40 turns are required for the movement of a single inch. Consequently, if the things to be measured vary much, considerable time is lost in screwing and unscrewing the spindle. It is desirable, therefore, to be able to move the spindle through the nut otherwise than by this slow means.

Quick Adjustments.

One, at least, of the leading manufacturers has on the market a caliper with which a quick adjustment may be made. The plunger is forced in by pressing against the outer end. This operates to disengage the nut from the screw. The screw may accordingly be moved through rapidly until an approximate position is gained, when engagement between nut and screw is resumed. Final position is secured in the usual way.

It will readily be understood that a caliper will become worn, so that after considerable use the zero on the thimble will not precisely correspond with the longitudinal line on the barrel when anvil and spindle are in contact. In order to meet this matter, one of the makers provides a thin shell or sleeve which covers the barrel. The barrel markings are cut upon this sleeve, so that, when it is desirable to make compensation for wear, it may be done by turning this sleeve on the barrel to a position where zero mark and long line will correspond.

By referring to Fig. 10 we have before us a view, partly sectional, of a Starrett micrometer caliper including a ratchet device. By attending closely, a sleeve may be seen enveloping the barrel. It is upon this sleeve that the barrel scale and vernier would be arranged. It is well to note, both in this view and in Fig. 1, the great width of the frame. This is so, no doubt, for the purpose of suitably distributing the metal to resist the powerful effect of the thrust of the screw.

Now the principle of the micrometer screw is employed in various styles of calipers to meet special requirements. It is also employed where the instrument can hardly be called a caliper at all. Thus caliper squares are constructed with a micrometer device which enables the workman to measure to .001".

The scale on the square proper enables the coarser reading to be made; the micrometer attachment is then employed to determine the truth with exactness. Reference has already been made to a method of quick adjustment. Another device employed by the same firm to secure the same general result consists in the use of a plug and accurately placed holes. The one jaw of the caliper slides along on a prolongation of the other. Both this prolongation and the part of the sliding jaw which envelops it have holes suitably arranged to enable positions an inch apart to be securely made with the aid of the plug. In this way the jaws may be set for every inch within the total capacity of six inches.

The movable jaw is fitted with a micrometer head. This enables accurate measurements within the inch to be made in the usual way. This instrument does not

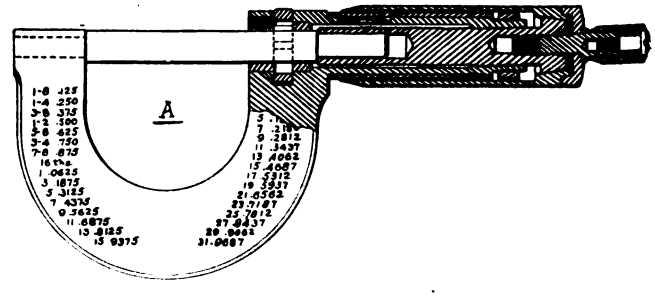

Fig. 10—Cross Section of Micrometer Caliper Fitted with Ratchet Stop

have the full six-inch capacity for round work, because of the interference of the prolongation. Round capacity is 4¼ inches. It will readily be seen that the slightest looseness in the fit of plug and hole would result in inaccuracy. The micrometer head would not nullify this.

To secure the necessary exactness of fit, the holes are provided with hardened steel bushings which are ground

Digitized by Google

and lapped so as to make them of precisely the same size as the plug. The limitation just noticed of what may be called the throat of the caliper would interfere for such work as the measurement of the thickness of sheet metal. Special deep throated instruments are made to meet this need. Thus, one style while only having a half-inch micrometer capacity has a throat two inches deep.

The Inside Micrometer.

For the use of micrometers for inside measurements, a variation from the ordinary caliper form is desirable. To meet such requirements, micrometer heads are arranged so that they may be attached to rods of known length. The micrometer then serves to give the fractional reading with exactness. Further, the rod of fixed size may be made in sections so as to enable a considerable range of capacity. In fact, instruments have been made whose maximum capacity amounted to 57, 82 and 107 inches. Such instruments are in use by the United States Government.

In fact, micrometer heads may be obtained which may be attached to machines or tools and thus afford a means of accomplishing fine measurements. This is a use which has not yet become as general as the employment of the standard forms, but no doubt the future will see such devices increasingly used as their possibilities become more commonly known.

Sometimes it becomes desirable to know with exactness the depth of a depression. A special form has been devised to deal with this need. A micrometer head is fitted to operate a spindle through a hole in a transverse piece. If one desires to know the depth of a hole, the transverse piece is placed across it and the spindle worked until its pointed foot reaches the bottom. The micrometric movement proper, however, amounts to but ½ inch. The spindle or measuring rod is provided with circumferential grooves arranged ½ inch apart. Clamping fingers are provided which engage with these, and thus the rod may be set to a point within the micrometer capacity.

One use for such an instrument is in connection with the Brinell ball test for hardness. In this test it is desired to know the area of the spherical depression made. This may readily be calculated if the depth is ascertained.

A rather difficult thing to measure sometimes is the exact size of a screw thread. Special calipers have been devised to meet this requirement. Thus, in one such device, the anvil is provided with a 60° groove. The inner end of the spindle is given a 60° point. However, the point is somewhat blunted to prevent its actual contact with the bottom of the groove of the thread. Also, the groove in the anvil is slightly cut away at the bottom to prevent contact with top of the thread. By means of these arrangements threads having an angle of 60° may be readily measured without contact of the micrometer being required anywhere except on the flanks of the threads.

Drove Past Standing Car: A coroner's jury of St. Louis returned a verdict of criminal carelessness against a driver of that city a short time ago. The driver is said to have operated his car at high speed and in violation of the traffic regulations, when he passed a street car which was discharging passengers. His machine struck an aged gentleman, who died later at the hospital.

A Peculiar Accident: Just as they alighted from their own automobile and attempted to cross the street, a machine, driven at a high rate of speed by an intoxicated chauffeur, drove over an aged couple, hurling them in front of an approaching trolley car. The trolley car also ran over them and mangled them badly. Later the driver was located and arraigned for homicide.

Driving Without a License: Early this month a driver of an automobile ran down and killed a 13-year-old boy who was riding a bicycle at the side of the road. Witnesses say that the machine was being driven at a speed approximately 50 miles an hour and that the driver did not seem to have control of it. Investigation by the police showed that the driver had just been refused a license by the State Board because he was unable to satisfy them that he knew how to operate a machine. Notwithstanding this, however, he drove his car without a license.

Car Hits Train: Underestimating the speed of an onrushing train, the driver of a car in Wilmington, Del., endeavored to cross the tracks ahead of it, and struck it between the tender and the baggage car. Before the train could be stopped, nothing was left but a mass of debris and mangled flesh. So complete was the wreck that it was impossible to determine the make of the car, and the man was identified with great difficulty.

One Killed; Five Hurt: Six soldiers hired a car and were in a great hurry to reach Camden, N. J., but their plans were somewhat upset when the car, going at sixty miles an hour, skidded on an asphalt roadway and turned over several times, landing twenty feet to one side of the road. One soldier was pinned beneath the car and killed. Five of the occupants were injured. The automobile had struck a slippery spot in the road, and then skidded. The driver of the car, who was not injured, was held, charged with reckless driving. The injured soldier was taken to Camp Dix in an ambulance.

An Intoxicated Driver: A man of Indianapolis is being held on a number of charges, and when he gets over his "spree" he will find that they are drunkenness, malicious destruction of property, and operating a motor vehicle when under the influence of liquor. This driver was operating his machine at a high rate of speed, swerved from the road, jumped the curb, went across a lawn, and crashed into the front room of a house. The floor in the front room was torn up, windows shattered, furniture and pictures broken. The damage was estimated at approximately $400.

Driving While Intoxicated: After having imbibed very freely of the certain something which will be scarce at the end of July, a jitney driver of San Francisco was driving along at such a leisurely pace, that he collided with a car standing at the curb, and sent it skidding across the street into the front of a building. A passenger of his own car was thrown out and badly injured. The car with which he collided was completely wrecked. The judge will most likely give him plenty of time in which to repent, and incidentally, sober up.

A Strange Accident: A car driven by a woman was proceeding down one of the main avenues of New Haven, Conn., when it struck a man, who, to save himself, grabbed one of the fenders and was dragged along. A part of his body is said to have struck another woman alighting from a trolley car, knocking her down to the pavement, the wheels of the car passing over her body. She was seriously injured, but the man sustained a few cuts and was treated in a nearby drug store. The driver was arrested for reckless driving and failing to produce an operator's license.

Driving Recklessly: A car driven by a naval man of Philadelphia, Pa., struck a mounted policeman, killing his horse, and injuring him. Witnesses claimed that the car was being driven recklessly, and there are further charges against the driver of assault and battery.

A Proficient Pupil: An automobile concern of Portland, Oregon, undertook to teach a man of that city how to drive their machine (if he bought it) in one lesson; said lesson consisting of instructions for stopping and starting the car. He was then declared by the instructor as able to drive the machine. While showing off his newly acquired knowledge, he forgot how to stop, and ran over a man and his wife. They were badly shaken but not seriously injured.

Ran Down Child: A chauffeur ran down and seriously injured a child in New York City a short time ago. The injured child was picked up by a soldier in a passing automobile. The driver was charged with having recklessly driven his car.

The Care and Repair of Tires

Part 1.—Dealing With the Construction of Tires, the Different Types, and the Curing of the Rubber

BY W. E. FABER

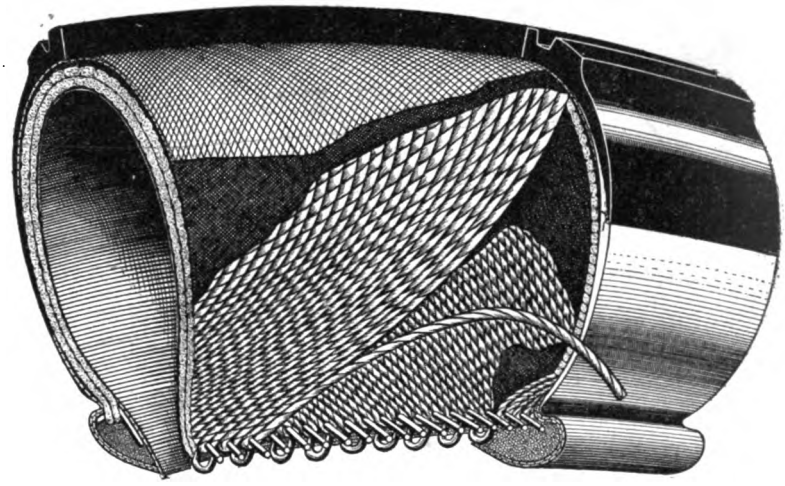
THE late George Fitch described the pneumatic tire as the "turkey buzzard in the ointment of the automobile owner." Most motorists will agree with him that tires cause the larger portion of the troubles that help to make the operation of a car retain the element of interest and uncertainty that has been a part of it since the days when exhibitors at the automobile shows demonstrated their creations by driving them around an indoor track, that was built for the purpose, adjacent to their booths.

Tires have their faults, it is true. But probably not less than ninety per cent of the failures of tubes and casings to give the service that is expected of them are due to mistreatment that follows a lack of understanding of the proper use of tires or just to good old-fashioned neglect.

It is really marvelous, when one stops to consider it, how a combination of vegetable products, the sap of a tree and the gossamer-like fiber from the seed-pod of a little bush, can endure with even a moderate amount of resistance the thundering impact of a two-ton car that is driven at railroad speed over roads that would destroy a tire of steel in a comparatively few hundred miles.

Preliminary to treating of the factors that cause the untimely deterioration of tires and the methods of coping with them, it is interesting to know something about the construction of a tire and the materials that enter into it. The average driver sees only a tube and a casing that he pays for and puts on the rim with a silent prayer that "this one will give some service."

Tire Construction.



Generally speaking, a tire consists of an outer casing of fabric covered with rubber, providing the tensile strength to hold the internal pressure and the resistance against road wear; and an inner tube of softer rubber serving as an air-tight lining to prevent the air from escaping. When such a tire is placed on a wheel and inflated, the effect is that the wheel is actually suspended on compressed air, the most elastic substance that is commercially available.

Slight shocks, which in the case of a solid tire would be transmitted in a direct line to the axle and thence to the body of the car, via the springs, are absorbed by a slight distortion of the air chamber.

The size and construction of tires have been so standardized that a study of any make gives an excellent idea of all makes. It is true that each maker has secret formulas for the compounding of rubber to obtain toughness, resiliency, etc., but the finished tires show little difference in the main.

Casings fall naturally into two divisions, those in which layers of canvas are used to give the strength, and those which are constructed of layers of parallel cords. Tire-makers say that the advantage of the former, and in fact its only excuse for existence to-day, is its low initial cost. The cord construction, while more expensive per tire, seems to offset this by the increased mileage which it gives and the smoother riding qualities it possesses by virtue of the fact that it does not need to be inflated as tightly as the fabric tire in order to prevent breaking down of the internal construction.

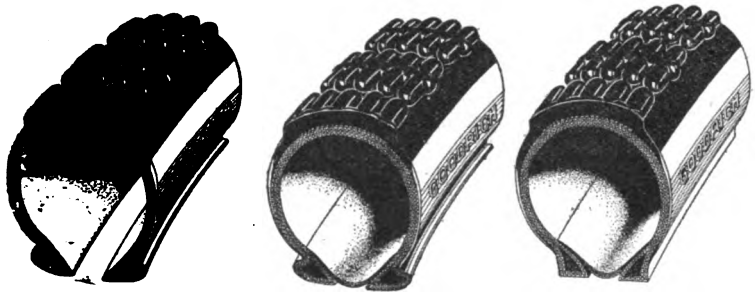
Both kinds of casings are made in three styles; they differ principally in the shape and construction of the beads, in other words, in the method of attachment to the wheels. The *clincher* tire has soft beads that permit it to be stretched over the rim of a wheel just the same as one would stretch a rubber band over a spool. This

Partial Cut-away Section of Goodrich Cord Tire, Showing the Two-ply Construction of Their Silvertown Tire.

style is now used only in the smaller sizes of tires such as are on Ford cars where the expense of any but the simplest rims would be prohibitive.

The *Quick Detachable Clincher* (known as the Q-D) has beads shaped the same as the regular clincher, but instead of being elastic, these beads have steel wires built into them. In placing this tire on the rim one side of the rim is removed and when replaced is locked by means of a spring or other device. The *Straight Side* tire also has a non-stretchable bead, but of different form, and is used on special rims somewhat similar to those used with the Q-D type.

Tread patterns are almost innumerable, apparently being limited in design only by the imaginations of the



Digitized by Google

manufacturers. They offer a means of adding to the thickness of the tread without making the tire unduly rigid, and under some conditions are advantageous in preventing skidding.

Two Materials Used.

It will be noted that the casing is made of two materials, fabric (which includes both the cord construction and woven canvas) and rubber. The fabric is usually a high grade of Sea Island cotton, which on account of its long fibre supplies strength and resiliency. The rubber merely holds the layers of fabric together so that they stretch and bend as a unit, and protects the fabric from actual contact with the road and from the deteriorating action of water, oil and other enemies.

The rubber has practically nothing to do with the shock-absorbing ability of the tire. That is all left to the air inside of the tire, and the chief function of the casing is to keep the air inside. It appears that if it were possible to make a tire as thin as this sheet of paper, yet with strength enough to resist puncture, we would have the ideal, so far as easy riding is concerned.

Regular Clincher, Q. D. Clincher, Straight Side. Cross Sections of Goodrich Tires.

It seems that the aim of the tire designer is to use as large a volume of air and as little canvas as possible consistent with adequate strength.

In making a casing, an iron core or mandrel, ring-shaped and having a cross section the same as the inside of a tire, is covered with several layers of fabric which have been thoroughly impregnated with rubber. From four to six layers are used, depending on the size of the tire. These are each carefully rolled and pressed together and as the fabric is applied it is continually stretched so as to eliminate stretching in use. On the fabric is placed a ⅛ inch layer of soft cushion rubber and over this comes a loosely woven strip of fabric—the breaker strip. Then comes the tread, compounded of tough rubber to stand the wear of the road. Of course the beads have been applied during the process of laying on the fabric.

Vulcanizing or Curing.

The next process is the vulcanizing or "curing" of the tire. (Some manufacturers partially cure the fabric body of the tire and the tread separately and then vulcanize them together later.) This is simply a matter of applying heat at a certain temperature while the tire is kept under pressure in moulds which determine its shape when finished, much as a waffle is moulded. Just as in culinary processes the temperature and the length of time heat is applied are vital to the success of the result.

In building tires by the wrapped tread method which is almost universally used for smooth tread tires, the pressure on the tire is obtained by wrapping it while on its iron mandrel with strips of muslin. Afterward iron moulds conforming to the finished product are clamped tightly over the wrappings. The whole affair, moulds, tire and mandrel, is then placed in a large cylindrical tank much like a boiler and large enough to hold many tires at one time.

Heat is applied for about an hour by admitting steam into the sealed tank at a pressure which corresponds to a temperature of approximately 300 degrees F. The steam itself has nothing more to do with the vulcanizing process than to distribute the heat uniformly over the tires being cured. Hot dry air, or any other method of supplying heat would serve the purpose equally well if means could be provided for a uniform distribution of heat.

The fact that steam, on account of its convenience for this purpose, is commonly used for curing rubber has misled many people into the belief that the steam itself had some mysterious chemical influence, or supplied moisture that prevented overcuring, but this idea is entirely wrong. At the temperature used in vulcanizing, steam contains less moisture than average illuminating gas. It is practically dry. Maintenance of the proper temperature is the important point.

The Inner Tube.

We have seen that the rubber used in casings is of a tough variety designed to stand the wear of the road. On the other hand the inner tube, which is protected from outside damage, and must remain absolutely air-tight, is made of quite a different kind of rubber. A very elastic compound is used, so strong that a good tube may be inflated until it is more than a foot in diameter without bursting. Demonstrations have even been made in which the weight of a loaded car has been suspended in the air by means of an inner tube, and most of us have seen cars towed by using a tube instead of a rope.

Inner tubes are made on mandrels, too, but in this case the mandrel is a piece of steel tubing of proper diameter, straight, and of a length equal to the circumference of the completed tube. This mandrel is put into a sort of lathe and as it revolves the raw rubber in narrow strips is wound upon it. Several layers of very thin rubber are applied to insure freedom from leaks that might occur if only one layer were used, and then strips of cloth are wound on top of the rubber to give the pressure that is required.

Curing is accomplished by inserting a hundred or more of these mandrels into a steam-heated chamber for a suitable length of time. When the cure is completed the

Digitized by Google

cloth is unwrapped and the rubber is stripped from the mandrel by turning it inside out, which accounts for the tube being smooth on the outside and rough inside. Then the ends of the tube are vulcanized together either by heat or by chemical means, a valve stem is attached and the tube is ready for use.

The matter of color in tubes and casings was discussed quite widely a few years ago. The natural color of pure rubber is a sort of amber. Some of the colors that appear in finished tires are the result of using chemicals that affect the properties of the rubber and others are merely a disguise to trade-mark a certain brand of tire. The only real proof of a tire is the service it gives, and if the tire is made by a reliable manufacturer and given reasonable care by the user, the service will, aside from unavoidable accidents, be all that can reasonably be expected.

(To be continued.)

*Editor's Note:—Mr. W. E. Faber is the Advertising Manager of the C. A. Shaler Company and is considered a high authority on tire construction, repair and vulcanizing. Mr. Faber has written for many book publishing houses and delivers lectures at the University of Wisconsin. We are indeed fortunate in obtaining this series of articles from Mr. Faber and we are sure that our readers will appreciate his work.

How To Lay Out and Cut Shaft Splines

This Work May Be Done by Any Repair Man in a Shop Equipped With a Small Milling Machine or Lathe.

BY AN OLD REPAIRMAN

SO many shafts and axles are now made with multiple splines that the cutting or re-cutting of them is a daily job in all large repair shops. Because the splines are rarely full length, a shaper is not adapted to the work. A milling machine is required, with more or less elaborate fixtures. To handle the longest splined shafts, a No. 3 miller is needed, but the cost of this and accompanying fixtures is prohibitive for smaller garage shops.

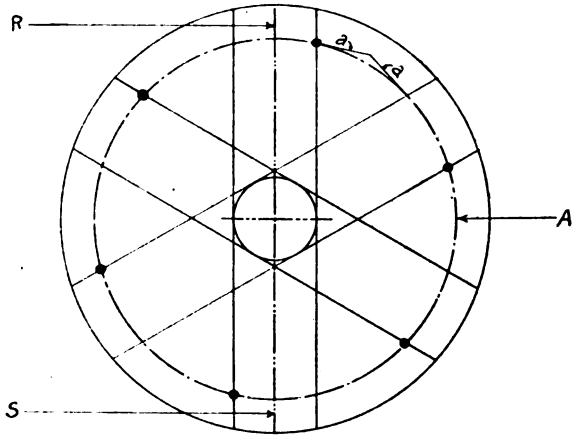


Fig. 1—The End of the Shaft Properly Marked for Splines.

It is the purpose of this article to describe tools and methods that are suitable for the garage of limited capital as well as for the larger ones. The entire outfit of tools may be bought for fifty dollars or less—it is assumed that the shop boasts some kind of a miller—a machine tool that is of even more importance than a lathe for repair work. Axles and shafts are parts that can be made as well in the repair shop as at "the factory" and the value of avoiding long and uncertain delays is a strong point in bringing more work into the shop.

Once in a while a factory shaft comes too large in diameter due to some change in sizes. After the outside diameter has been reduced in the lathe, it is necessary to deepen the splines, which is comparatively simple, for the existing ones serve as guides in setting up. The underlying principle of setting up and cutting is the same as for new shafts—to follow.

The layout for a six splined shaft is shown in Fig. 1. A center line is first scribed across the end of the shaft, using a center head of a combination square for the purpose, and a second center line made at about right angles to the first. About the center thus located a circle is scribed having a diameter equal to the width of the splines to be. Another circle as A may be drawn, the size of the bore of the sleeve into which the shaft is to be fitted.

Lines parallel to the center line and tangent to the inner circle, lay out two opposite splines, R and S. Taking the intersection of one of these lines with the circle A as a center for spacing off and with a radius equal to the radius of A, six points are located which are on the lines passing across to the other splines, and these can be drawn.

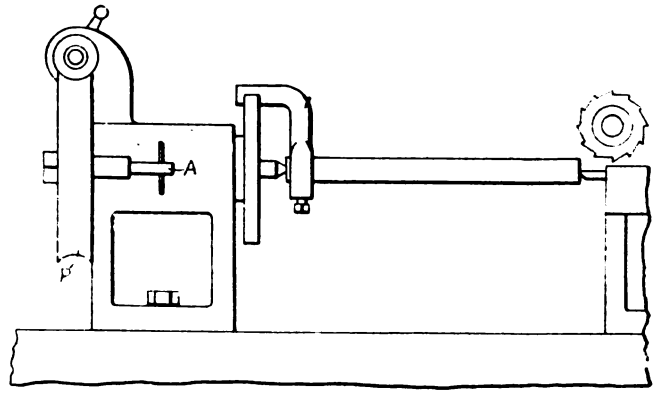

Fig. 2—Method of Mounting in Miller.

Digitized by Google

Six divisions are most easily laid out by using this radius of the circle for a spacer. Eight divisions can be obtained by two center lines at right angles, checked with dividers until correct, which gives four equidistant points, and these four are then subdivided. A ten spline shaft is laid out by one center line and dividing the semi-circles into five equal divisions. A twelve spline layout is made by dividing each of six into two parts.

Direct Indexing.

Fig. 2 shows a shaft set up ready for milling "on the centers." Such an arrangement is always best where the miller is large enough. A pair of plain index centers are all that any garage shop needs and they are far cheaper than the more elaborate sets. An index pin A engages the rows of holes in the plate P, a circle of holes being selected which is a multiple of the number of divisions to be cut. The plate P is fast to the spindle; It is turned directly or in some constructions is worm

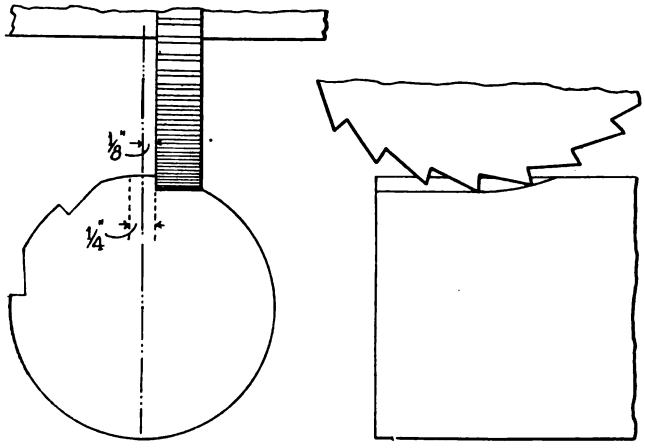

Fig. 3—Location of Cut, Using Single Cutting Wheel.

driven as shown. This method is called "direct indexing."

Each spline occupies the position of an inserted key if the construction were built up instead of solid; hence the edge of the cuts are in the same position for each case but with one it is an inside cut and with the other an outside cut. Fig. 3 shows this. The spline is to be ¼ inch wide and so the nearest edge of the cutter is ⅛ inch away from the center line (no part of the cutter is ever nearer than half the width of the key). Three cuts have been made in Fig. 3—all on the same side of the center and after the remaining five have been made in the same way, the position is changed to the opposite side of the center and eight cuts made there, completing the shaft.

The sides of splines are never on a center line, but parallel to it as has been shown. To get this result, care must be exercised in setting up other than to have the cutter so far from a laid-out center. One way is to rest a square against each side of the shaft in turn and to turn the shaft until the distance is the same from the square to the line at each side of the spline—this is probably the shortest way for all around use no matter how the shaft is held.

Another way is shown in Fig. 4 where the shaft is gripped in a vise and rests on a parallel piece H. In this

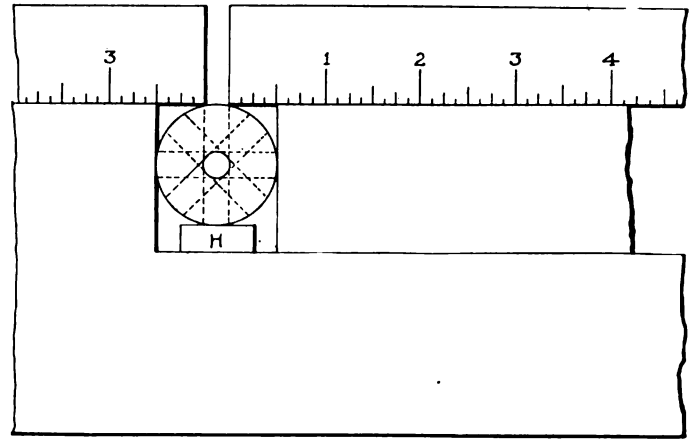

Fig. 4—Method of Laying Out Splines.

case the splines are all laid out. Then a measurement is made and the shaft set so it is the same at both sides, measuring from the vise jaws as shown. This must be repeated for each side of each spline.

A Few Extras Are Handy.

A few simple accessories will materially shorten the time it takes to finish a shaft. In addition to the time saved, a machine that is badly needed for other jobs will be released just that much sooner. Then too, the chances of errors with an inexperienced man are lessened in proportion as the work is made simpler.

Half of the indexing or the setting by measurement may be saved by using two cutters on the miller arbor and finishing both sides of a spline complete at one cut. Fig. 5 shows this arrangement. The two cutters of course must be of the same diameter. Then several col-

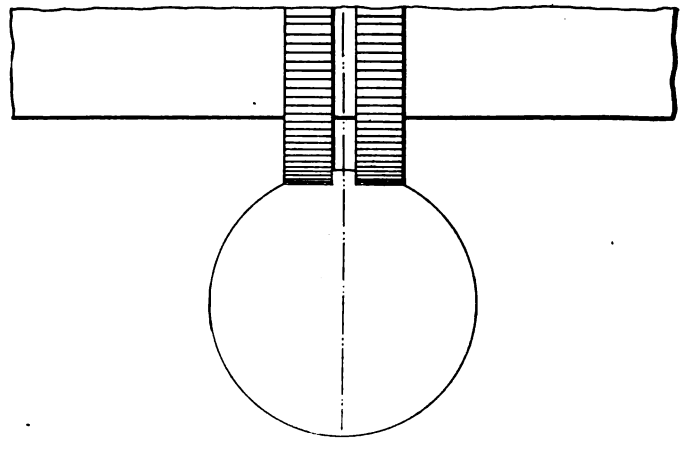

Fig. 5—Cutting Spline with Two Cutters Mounted in Gang.

lars to go between the cutters must be provided, the widths to be standard sizes like ¼ inch and ⅜ inch, such as are the keys they are to straddle. Collars and cutters need not cost over five dollars. In setting up, each

Digitized by Google

cutter occupies the position that the single cutter on each side would, i. e., nearest edge half the key width from the center line.

Factory made shafts are cut with a cutter that forms true arcs between the splines. These arcs are like the circle A in Fig. 1. Repair shop shafts approximate these arcs by cutting two or more flats as a-a, Fig. 1, and by either a third cut in the center to take down the ridge or by filing it down. The faces a-a are left by the cutter as it mills the sides of the splines—sometimes the cut is made deep enough so that the point of the cut is the full depth of the circle A, which makes further dressing unnecessary.

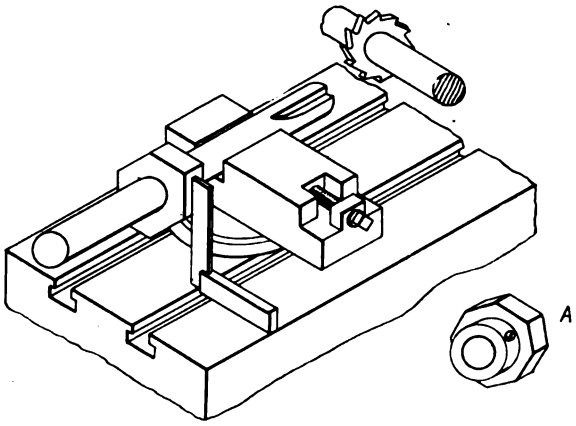

Fig. 6—Cutting Splines on Lathe, Using a Hex Collar.

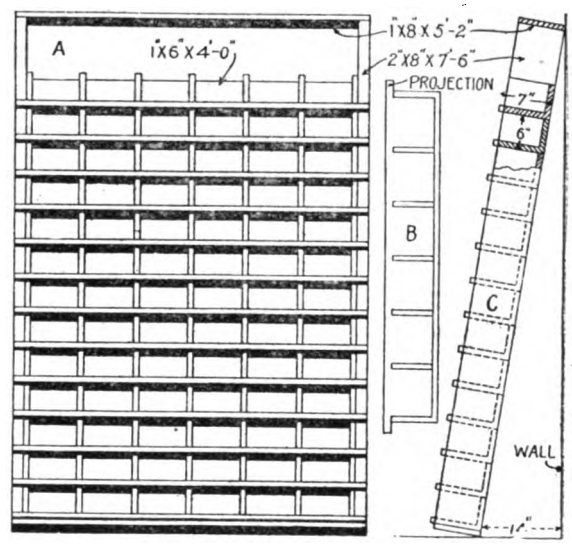
Splining Long Shafts.

Long shafts cannot be handled between centers on a small miller, and some shops have no centers at all. It is for such cases that the full layout is made as in Fig. 1 (for a shaft on centers but one spline needs to be located, the index head repeating this layout automatically for the rest). Shafts thus cut must be held in a vise, or chuck, or be clamped directly to the table of the miller. Fig. 6 is a way of avoiding the tedious layout on such shafts once and for all.

Three cast-iron index collars are made up as shown at A. The hole is made as large as the largest shaft it is intended to handle, the outside diameter of the hub part sufficient to give set screw length, the size of the flattened part preferably three to five inches, and the length as desired though a total of one inch is enough. One collar should have six sides, one eight, and one ten—divisions of three, four and five can be obtained by alternating. These collars may be provided with a set of bushings to fit standard sizes of shaft from one inch up, or a long enough set screw may be provided to compensate alone for the different diameters, though this is the poorer way.

The method of indexing with such equipment is shown by Fig. 6. Lines for one spline were scribed anywhere on the shaft and the latter centered in the vise and with the cutter from them. Then the indexing collar is put on the shaft and the set screw tightened when one face is true with the square as shown. After one cut is made, the shaft is turned until the next side of the collar is square and then a second cut is made. This is repeated until the cycle is completed. It would make no difference in indexing whether one cutter (as shown) is used or two as in Fig. 5. If the garage shop has no means of accurately facing the flats of the collars, any machine shop can do it quickly and when ready they form a simple and accurate means of indexing for a variety of jobs.



Whatever the method followed, once a setting is made for position and depth no alteration need be made for the rest. The superiority of the splined shaft over the one with inserted keys has resulted in its rapid ascendancy and the effort to be in a position to turn these out on a commercial scale will be worth while in every respect.

A HANDY BOLT RACK.

One of our subscribers, who formerly was a blacksmith, a short time ago forwarded us a sectional model of a bolt rack that should be of interest to every owner of a repair shop, machine shop, or garage.

This bolt rack consists primarily of a heavy frame, made of planks 2 by 8 inches, 7½ feet in length for the sides and for the top and bottom, planks one inch in thickness, eight inches in width and five feet two inches in length.

This frame may be bolted to the wall, or stood upon the floor as shown in the figure at A. The compartments, one of which is illustrated at B, are in sectional form; that is, each shelf is independent and made from a flat board one inch in thickness which has been cut so as to leave a projection upon each end as shown at B. Upon this base are constructed the division walls and the back of the bins.

A Handy Sectional Bolt Rack.

Only the sides and backs of the bins are provided for each section, for the bottom of one section forms the top of the one below it.

These bins may be made in varying sizes and stacked in the big frame, one upon the other as shown in the illustration at A and at C.

Automobile Dealer and Repairer

A Magazine of condensed and compact information for busy readers.

Member of the Audit Bureau of Circulations.
Member of the Associated Business Papers.

PUBLISHED THE MIDDLE OF EACH MONTH BY

THE MOTOR VEHICLE PUBLISHING CO.
71-73 Murray Street, New York

Telephone, Barclay 7377 Post Office Box 654

CHICAGO OFFICE, Lytton Building, 14 Jackson Boulevard

Entered as second-class matter at the Post Office in New York City.

M. T. RICHARDSON, President and Treasurer — F. R. WHITTEN, Secretary

M. T. RICHARDSON, Editor
FRANK L. AVERY, Managing Editor

F. R. WHITTEN, Advertising Manager — H. F. LUDINGTON, Western Representative

GEO. A. SMITH, Eastern Representative
FRANKLIN MYERS, Art and Copy Dept.

TERMS OF SUBSCRIPTION.

One Copy, One Year, Including Postage.....$1.00
One Copy, Six Months.....60 cents
Single Number.....10 cents
Except in zones 7 and 8, comprising the following States: Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington, Wyoming. In all these the rate is $2.00 per year, made necessary by the unjust increase on the part of Congress in second class Postage.
Foreign Subscriptions.....$1.50, or 6s. 3d.

Remittances should be made by Express Money Order, Draft, Post Office Order, or Registered Letter. Foreign remittances, where possible, by International Money Order.

ADVERTISING RATES SUPPLIED ON APPLICATION.

The Automobile Dealer and Repairer in New Zealand.

Mr. R. Hill, Matlock House, Devonport, Auckland, New Zealand, is our accredited representative in New Zealand for obtaining new subscriptions.

MISSING NUMBERS—Our readers are requested to remember that we are always pleased to re-send numbers which have gone astray in the mails.

The Passing of One of the Country's Greatest and Ablest Statesmen.

AS this magazine goes to press, we hear of the death of one of our most beloved and honored citizens, the Ex-President, Colonel Theodore Roosevelt. Without doubt, Colonel Roosevelt has been one of America's greatest patriots. Truthful and just, he has always placed the welfare of the nation before personal aspirations.

During his Presidency he proved himself to be the people's advocate, fearlessly fighting their battles, unafraid of capital, and equally honest in his convictions upon the side of capital when it was in the right. He did his duty as he saw it, showing favoritism toward none, dealing out justice to both friend and foe alike.

He was gifted beyond the average man, in that he could look upon the country as a whole, see what was fitting and best for the masses, and act accordingly, not permitting the feelings of a few to alter his purpose.

Colonel Roosevelt was one of the few who are able to draw conclusions from current events and forecast the future happenings. He alone of all our statesmen realized the value of preparedness and had the courage to speak his opinions. That he was right has been proved.

America should mourn his loss the more deeply because she owes him a debt of deep gratitude. He did much to further the cause of Liberty and Justice and to arouse the people from their lethargy and free them from the shackles of Pacifism.

The American people have lost one of their best friends.

A Word Relative to the Increased Subscription Price of This Paper.

ON page 36 of this issue, we announce the increase in the subscription rate of this magazine. We have taken this step only after much careful thought and contemplation. We feel sure that we will not lose a single friend by this increase, for the very reason that we intend to give full value for every cent received.

In all justice to our subscribers, we could not put out another number without decreasing the quality of the reading matter, at the old subscription price. We know that our readers are entitled to the works of the best authorities, and are willing to pay for such articles.

We have always strived to keep the Automobile Dealer and Repairer the BEST magazine on the market in its field. A magazine that would be awaited eagerly by all the subscribers, a paper that would solve the problems of the perplexed motorist and an authority on automobile subjects of a mechanical nature.

We do not claim to publish an ornate collection of photographs in every issue; we prefer to spend our subscribers' money for timely mechanical articles. We do claim that the motorist who subscribes to our magazine, and reads it thoroughly, will save many times the cost of the paper.

If Our Workmen Desire High Wages They Must Put Out Good Work.

THERE is an old saying "Anything that is worth doing at all, is worth doing well," and this adage should be brought to the attention of the American laboring man. Gompers has stated that Labor will never permit Capital to reduce wages and salaries to a pre-war basis. If he is right, it is high time that Labor and Capital reached an understanding with each other.

By and large, the American worker has formed the habit of carelessness. He is not wholly to blame, for the habit has been forced upon him. The employer has demanded increased production, has eliminated the personality of the man and reduced him to power units. has made him a machine and taken away the incentive for improvement.

There has been, and still is, a lack of co-operation between Labor and Capital. If America expects to lead the world in production and commerce, she must remedy this defect and consolidate the interests of the two.

No matter what the attiude of Capital, Labor must cure her careless habits. The American laborer must school himself to do his best work. He must strive to produce only the best.

Digitized by Google

The writer has in mind an example which will serve to illustrate the point we are considering. For nearly five months he has purchased regularly, safety razor blades from a prominent manufacturer of such articles. It so happens that this maker is the only one who produces the type of blade that will fit his razor. On an average only one out of twenty of the blades is fit to use.

Undoubtedly such a low percentage of good blades will be noticed by the trade at large and within a short time no one will purchase either this razor or blades for it. The manufacturer will either be forced out of business, or into another line. His employees will suffer by the change, even if they do not lose their positions.

In this case, is not the laboring man to blame? Evidently he is not doing his work to the best of his ability, and in the long run, he will suffer through his own carelessness.

There are thousands of such examples to be found in the country. Industries which never seem to grow, but which flourish for a brief period, then drop into obscurity. It is a phase of the present Labor question that should deserve considerable thought by the workingman.

Protect American Labor and Industry.

WHEN the great European war broke out on the first of August, 1914, this country was in the midst of a serious business depression. Industries everywhere were either curtailing their output or were closing up entirely from lack of orders. Thousands of men were out of employment and soup houses were being talked of and established in some places. It has been claimed with considerable reason that the Underwood Free Trade Tariff measure which had been enforced for some time was the cause of the depression which had spread over the country. Goods made in foreign countries by cheap labor had been sent over here in large quantities and were supplanting similar goods made by our own people.

During the year 1914 Bradstreet reported 427 failures in the entire country for one week in December of that year. For the corresponding week this year the failures were 162. Of course everybody knows that the war stopped the importation of goods from foreign countries to a large extent, and had very much the effect of a protective tariff, with the result that our manufacturers were once more in a position to take orders and fill them and our people were employed fully everywhere.

The war is now over and the Underwood Free Trade Tariff will soon commence once more to get in its deadly work, unless Congress enacts a satisfactory tariff law to keep competing goods out of the country. As the next Congress will be Republican is can be assumed that such a tariff will be put through as soon as possible, but unfortunately this Congress will not meet for work until December, 1919, unless called in special session by the President, so that the country is apparently exposed for a year to the blighting effect of the Underwood Free Trade Tariff measure.

The Important Part That Automobile and Accessory Shows Play in Motordom.

IF one has given but little thought to the matter, he is prone to feel that an automobile or accessory show is a waste of money. One is apt to think that the only persons interested in such exhibitions are those who intend to purchase.

No matter whether one is a grocery store clerk, a bank cashier, an insurance agent or a furniture manufacturer, an automobile or accessory show can be made of value to him. All statements to the contrary, notwithstanding, an automobile show or an accessory show or a truck show, is as much value to the business man, if he knows how to make use of it, as it is to the exhibitors.

Every man, if he is enterprising, expects at some time to own an automobile and one has but little patience with a prospective car buyer if he doesn't know what kind of a car to purchase. Naturally, if one does not keep himself informed, he cannot expect to make a satisfactory decision.

And to inform prospective car buyers, is one purpose of the automobile show. Contained in one building, usually within a few yards of each other, are hundreds of different cars. Comparisons may be made with ease and in a minimum amount of time. The buyer can visit back and forth and once he has purchased, he feels secure he has purchased the car that he knows possesses the greatest number of points he desires.

Questions brought into his mind by the statements of one salesman, can be answered within a minute by the salesman of the other car.

Perhaps one has no idea of buying a car; even so, however, he cannot afford to ignore the show. As a business proposition, if one were a bookkeeper he would keep informed as to modern office methods. So it is with the business man. The automobile may be considered as a business necessity. It may be of value in your business. You may find, upon investigation, that with such a machine you can increase your business and profits many times.

If you are an employee, you have a duty toward your employer. Keep informed as to business equipment. Find out what can be done with trucks or automobiles. If you can install equipment that will save your employer money or increase his business, your own value increases in proportion, if not to him, to someone else.

Of equal value is an accessory exhibition. You can no more afford to neglect this department than you can afford to neglect insurance. There are upon the market accessories which when placed upon certain cars will increase mileage and decrease gasoline consumption nearly 100 per cent.

Digitized by Google

Not long ago the writer's attention was called to the fact that there was a difference of fifteen dollars in the prices of two necessary accessories. The total cost of the more expensive was eighteen dollars, while the three dollar article, in the writer's estimation was just as good if not better than the more expensive one. At any rate both accessories gave an equal amount of service by actual comparison.

A HANDY FIXTURE.

The writer was in a small garage a short time ago and noticed that the workbench was singularly free from unsightly dents. Investigation showed that the owner had obtained a twelve inch section of an ordinary rail, from the railroad agent, and had bolted it to the end of the bench.

Locating Grounds and Short Circuits

How An Enterprising and Intelligent Farmer Uses the House Telephone To Locate Electrical Troubles.

BY JAMES F. HOBART, M. E.

THE town dweller, and user of an automobile, may consider himself in luck. In case of trouble, he can step around the corner to a garage or repair shop and get things fixed in a jiffy. But in the country, O me! O my! Here, eight miles from the railroad, except in one direction where it is ten miles! With no Sunday paper and no daily paper between Saturday and Tuesday noon, the repair shop is rather an unknown quantity, to say the least!

On this 300 acre farm where the writer has been visiting for several weeks, there is a good automobile, which, like all others, has its troubles occasionally or oftener, and when the starter went bad one day recently, there was some lively hunting for leaks. A test of the storage battery electrolyte showed the proper degree, and the farmer was at a loss to determine where the trouble was.

He tried sparking across the storage battery terminals with a bit of wire but, while he got a good spark across the terminals, he failed to get much while sparking across each cell. Too low voltage to show much spark. To overcome this difficulty, he took an old jump spark coil, attached two wires to the terminals, placed the coil out of the way on a bench and used the terminals of the wires as test points.

The "kick" of the spark coil caused a much more visible spark when the test terminals were scraped across the storage battery terminals and in this way, he was able to determine that a cell at one end of the battery did not show as much energy as did the other two cells. Here was a clue to work on and after hunting for short circuits in vain, the farmer sat himself down and began to make deductions—something which should be done first of all when trouble is met with—and to reason from effect to cause.

"Circuit's all right," he remarked. "Ignition works well but is weak. Horn blows all right, lamps glow, but a trifle dim. Self-starter won't work at all, so trouble must be right in one cell of the battery, or mighty close to that point!" And taking a wrench to the battery terminals, he removed one of the cables which led to the starting motor and its connections.

"Might as well start right here," he continued, "for if the trouble isn't inside of the storage battery, it must be mighty close by on the outside." Then he wiped the battery connection clean with a bit of clean cloth and wiped along the armored cable towards where it connected with the starter push-button. About five inches along the armor, his finger sank into a depression in the armor. He was interested at once, and wiping that part of the armor very clean, he examined it closely and found to his surprise that a hole had been worn right through the armor, A Fig. 1. through the insulation B of the cable and the cable C itself had been brightened!

Repairing the Break.

"Somethin' doin' right here," grunted the farmer, then he began to look for the object which had drilled the hole through the armor. He found it in the other terminal of the cell to which the worn cable was attached. The armor had been resting upon that terminal and vibration of the car had caused the terminal to wear a hole in the armor, and as stated, clear through the insulation so a short circuit of the end cell was formed through the cable.

The farmer said something forcible, covered the hole in the cable with tape, D, then wound some wire around the cable, outside of the armor, thus repairing the damage. Then, to prevent a repetition of the trouble, he selected a piece of stout sole leather, E, scarfed the ends as at F, with a carpenter's jack plane, wet the leather and wound it around the repaired place in the armor. The leather was cut just long enough so that when scarfed and lapped, it laid evenly and smoothly around the cable. Then some copper wire, G, was wound around the leather, five or six coils of the wire at each end of the leather and about three inches apart; the wires being placed in such a manner that they came on either side of the cell-terminal and there was no danger of ever wearing through the copper binding wires. To make sure that the wire would never come off, even though one coil should become broken or worn through, the farmer got out his soldering copper and ran on a streak of solder clear across the wire winding. Then, should one wire

Digitized by Google

break, it was still held to the others and the winding could not loosen and come off of the leather.

The farmer "allowed" that the mending would "hold for a while" and, taking the hint, started to look over all the other armored wires attached to the automobile. And he found something. Working along the ignition wire, something was found right where the wire passed into the engine compartment. Right under the end of the hood, the wire rested against a steel angle which

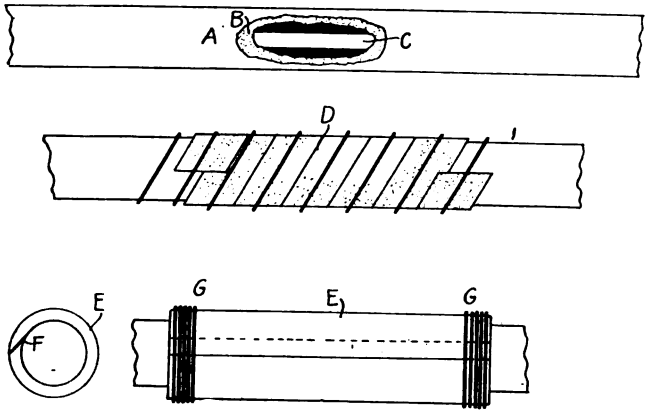

Fig. 1—How the Pipe Was Repaired.

supported the frame portion of the "dash," and there it was found that the steel angle—not a sharp corner either—had worn a hole through the armor but had not perforated the insulation. A similar treatment was applied to this embryonic short circuit, and the search was continued and revealed two other places where the armor was slowly but surely being perforated.

Hunting "Grounds."

This farmer said that he "had some derned suspicions" that there might be some grounds in the ignition or lighting circuits, and he was "sure goin' to hunt 'em right out." And he went at this work in a mighty original way. He went into the house and came back, bringing the telephone receiver A, Fig. 2, which he had removed from the rural line instrument in his living room. "Yep," he said—they can ring us up all right but we can't hear them talk until I put this here phone back agin but it won't do much harm to cut off the "Daily Gab" for a few minutes."

Then the farmer took the two wires, B, which had been attached to the old spark coil, and connected one of them by means of a little clamp, C, to one of the telephone wires, D. The other end of that wire was attached to a terminal of a dry cell, E, which had been placed on the bench where the spark coil had laid. The other wire was attached to the other terminal of the dry cell and its free end carried to the engine, F, and grounded securely. Then, with the telephone receiver to his ear, the farmer-man went all over the electrical connections of the automobile. He touched each binding post and spark plug and went over the storage battery terminals and all the timer connections which he could reach. He used the free connection G from the receiver to do the testing act with, and whenever he heard a noise in the receiver at his ear, he knew that his fingers were drawing the contact over a section of electrical work which was in some manner or other, grounded to the engine.

He had not tested many parts when he heard a tremendous scraping and banging in the receiver. Just then, the farmer was drawing the contact point over the end to a spark plug. He at once detached the ignition wire from that plug and then drew the point across the plug again, taking care not to touch that portion of the plug which was screwed into the engine. He heard the same noise in the receiver. Then, he scraped the 'phone wire across the end of the wire which had been disconnected from the spark plug, but did not hear any noise in the receiver when doing so.

"That plug is sure grounded," said the farmer. He took out the plug in question and found it to be all covered with soot—finely divided carbon, which formed a coating that conducted the ignition current over the surface of the porcelain to the engine. The farmer went all over the wiring, as much of the timer as he could get at, and over the terminals and starting push of the engine, but found nothing wrong. Then he said he would test the wiring for loose connections.

Finding Loose Connections.

To make this test, the farmer disconnected the other terminal from the storage battery and connected the test point—from the telephone receiver—to one of the storage battery connections, and then removed the grounded wire from the engine frame and attached this wire to the other storage battery terminal. He did not actually connect these two wires to the storage battery terminals, but to the connections which he had discon-

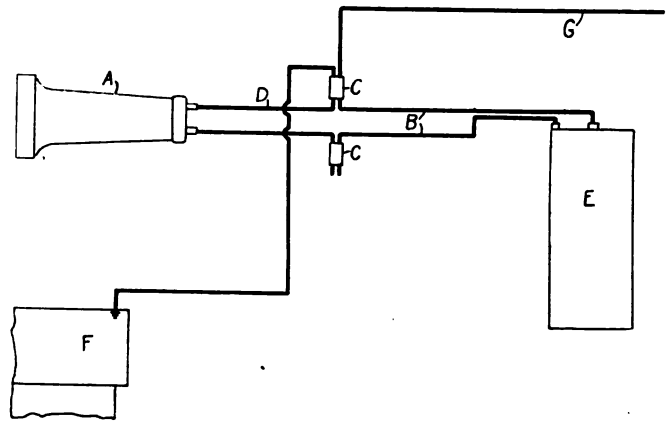

Fig. 2—Using the Receiver as a Tester.

nected from the battery, thus putting the telephone and the single cell of dry battery in place of the disconnected storage battery.

Had the farmer but known—I told him about it afterwards—he had no need to disconnect the second terminal from the storage battery. It would have answered every purpose had he simply attached one of the test wires to that terminal without disconnecting it from the storage battery; then by attaching the telephone wire to the

Digitized by Google

other terminal, which was removed when hunting the short circuit.

With the receiver and dry battery thus connected across the line, Mr. Farmer held the receiver to his ear with one hand and with the other, he shook each and every connection of the wiring. Nothing was heard in the receiver until he reached one of the lamp connections—he turned the lamps "on" before making the loose connection test, but when he rattled the loose connection, the phone receiver rumbled and thumped like mad and the farmer knew without being told that he had found a loose connection. Whenever a loose connection was found, it was at once tightened and tested again after having been screwed up.

"At first," said the farmer, "I used to get all tangled up in the primary and secondary circuits of the spark coil, but I figured them all out and now I can hitch right on to the circuit which needs testing, and root out any loose connection instanter."

"How did you come to know of this way of testing," the farmer was asked, and he said, "Well, I first got against it by 'monkeying' with the telephone. One of the wires connected with the receiver, was always getting loose in its binding post and would occasionally fall out. I got in the habit of tightening that binding screw every time I used the 'phone, and frequently used to hear a rattling sound when I tightened the screw or when I replaced the wire after it had fallen from the binding post.

"Then, I began to investigate to see what made the sound, and found it was caused by the battery current acting upon the receiver diaphragm as more or less current passed, owing to good or poor connections at the loose contact and binding screw. Then I did some heavy thinking and worked out the loose-connection detecting stunt. After that, it was not long before I figured out that I could find a ground in the same manner, or find whether there was a ground or not, and from that, I worked out the 'stunt' of ground-hunting same as we did it a while ago."

The scheme was a good one and this farmer had worked it out all by himself although others have used the loose connection finding trick for many years. But I believe the detection of grounds by means of a telephone receiver, at least in an automobile, is novel, and originally worked up by this very progressive farmer.

Locating Spark Position.

Be that as it may, there is stil another phase of the receiver business, one which the farmer has been very close to, and actually touched without realizing the value of the method. That phase is the use of the receiver to determine the instant of ignition in each cylinder, also the advance actually made in spark angularity when running with the lever in any given position.

To do this, the spark plug to be tested must be grounded outside of the engine and the phone itself may be used to do the grounding, provided it is not easier to cut in the receiver and battery at some other place. Then, having made sure that the receiver is connected across the proper circuit, have the engine cranked very slowly and listen to the "click" in the phone which tells when the timer makes connection with that spark plug circuit. Means may be taken to measure and record this position, and when the firing points of the other cylinders may have been determined in like manner, they may all be laid down on a diagram and you will be able to tell whether or not each cylinder is ignited at the proper instant, or whether or not, as the spark is advanced, each cylinder has its ignition advanced in a regular and a proper manner.

It only requires one to listen at a properly connected telephone receiver to determine the exact time and angle of contact of the timer and by turning the crank slowly and repeating the turning movement several times, it may be known whether or not ignition always takes place at the same point. Some valuable information may be obtained by testing around an automobile wiring with a telephone receiver and a cell of dry battery.

The farmer, in making the loose connection test, might have dispensed with the cell of dry battery just as well as not. All he needed to have done was, when one terminal was removed from the storage battery, to have connected the telephone receiver, without the cell of dry battery, between the storage battery and the removed terminal. Then, the telephone would be "in series" with the storage battery and the wiring and the loose connections could have been tested out by current from the storage battery.

THE POLARITY OF CURRENT.

The novice frequently asks the question—"How can I tell the positive wire of a circuit?" Frequently when one desires to charge storage batteries from an outside source of current the same question arises, since lead wires are seldom marked.

Obtain a small glass, a drinking glass will do, and fill it with a strong salt solution, made by mixing table salt with water. An acid solution, composed of sulphuric acid and water, (electrolyte) will answer the purpose as well.

Into this liquid, dip the two lead wires from the source of current. Hold the wires about half an inch apart and you will notice that a great number of bubbles of gas arise from the negative wire, while only a slight amount of gas, comparatively speaking, is liberated at the positive side.

Water is composed of two atoms of hydrogen and one of oxygen: electrical current decomposes it, the hydrogen being liberated by the negative current, oxygen by the positive. Twice as much gas will therefore be liberated at the negative wire.

Taken From a Mechanic's Note Book

As We Look Over The Repair Man's Memorandum Book. We Find Some Notes Regarding Lubrication.

BY J. FRED GILMAN

LUBRICATION may be portrayed as the keeping apart of two conflicting surfaces, by means of a substance, the molecules of which slide past one another with much less effort than the surfaces that they separate. In the case of the "flivver" this substance has been repeatedly defined as something necessitating the carrying of quantities of incense, thus forcing the public to disbelieve that said "flivver" is a part of the Dead Sea.

When one buys a new car he will of course follow out the suggestions set forth in the instruction book as to the kind and grade of oil to use. Each individual manufacturer determines the oil which is best suited to his engine only after long and thorough tests.

The greatest economy is effected when not a drop of oil more than is needed is used. Oil, on a part, if not absolutely necessary to it, is wasted and an excess amount of oil on a needy part does no good. On the other hand, a driver applying too little oil on a working part is most certainly courting disaster. Determining the correct amount of oil will be very easy if one will use a little reason mixed with the oil.

Watch the exhaust closely and if no smoke shows when the engine is running at ordinary speed but a faint smoke when the engine is speeded up, then one has the correct amount. If the engine smokes at all speeds, too much oil is being supplied. If, on the other hand, the engine cannot be made to smoke at all, there is great danger of insufficient lubrication and this condition should be watched and guarded against.

Some owners put oil in their engines and then wipe their hands with that satisfied feeling of work well performed. If the truth was made known to them that this was only a part of their duty, they would also consider it highly profitable to watch and see that the oil level gauge is operating properly.

Most modern engines are fitted with two danger oil alarms. One is the reservoir gauge and the other the circulation gauge. This latter gauge is of particular importance, if you are interested enough to interpret its various readings. Dirt in the oil will gradually cause a back pressure on the gauge, forcing it to read abnormally high. If there is a break in the oil line or in the pump the result is a low or negative reading.

Failure of these gauges to register is not viewed with any great consternation by the average motorist. This usually is because he does not realize that so much depends upon the lubricating system, nor does he appreciate that even the simplest, most ordinary lubricating system is a wonderful thing. The marvel is that, considering the extremely hot gases and other difficulties under which the engine is made to operate, it works at all, even under ideal conditions.

I am OIL.

*

Preventing mechanical trouble is my great specialty. I am the Guardian Angel of engine troubles.

*

Some have eyes, but see not; I have no eyes, but see.

*

When wanted I am wanted BADLY and nothing will take my place.

*

The wise motorists keep me near them on every drive.

*

The expert garage man uses me to seal his finished work.

*

Every day I become better known. Every day those who know me speak of me as a friend for I am faithful.

Much greater will be the motorist's wonder, when he realizes that the engine will operate under adverse conditions and usually without serious complaint. Suppose we consider for a moment the lubrication of the piston and some of the conditions under which it operates.

The piston is lubricated with oil that is splashed onto the cylinder walls, the movement of the piston up and down spreads the oil the full length of the cylinder walls and upon the piston surfaces. Sufficient oil and not too much must be fed the engine or it will smoke and here rests a difficulty—it must be fed just enough, and not too much. So, if anything happens to the oiling system, whether the happening is lack of oil, poor oil, or whatever the cause, there is the immediate danger of the piston scoring the cylinder walls.

The upper half of the piston is extremely hot and unlike the cylinder wall and cylinder head, is not water cooled. The flat head of the piston is exposed to gases varying in temperatures to 3,000 deg. F. This temperature will be better appreciated if it is stated that water boils at 212 and the ordinary gas jet flame is 700 deg.

This intense heat must be conducted down through the sides of the piston, where it must jump across to the cylinder wall. Therefore, the upper part of the piston where it touches the cylinder wall must be quite hot. So hot in fact that it is marvelous that it is possible to keep any oil on the upper part of the piston at all. So here is the reason why the real lover of an automobile engine

Digitized by Google

immediately finds out why his oil gauge has distemper, while the amateur driver tries to find out why his engine begins to resemble a boiler factory at full production.

Usually, the heavier the oil the better, so far as crankshaft and other bearings are concerned, that is, if the oil can get between the required surfaces, for greater pressure is required to push it out. It is also better for the cylinders, as it aids compression and seals up the minute spaces around the piston rings.

Oil Seepage.

If oil works past the rings in any quantity, however, the result will be fouled spark plugs, excessive oil consumption, carbon deposits between the valves and their seats and a loss of power by leakage and pre-ignition. This, however, would not be the case with heavier oils for these need longer time to burn than the duration of the firing and exhaust strokes combined.

A few manufacturers use very close fitting pistons and therefore are compelled to employ a light oil. Others allow more clearance and use a heavier grade of oil. The latter method is the best for the various reasons mentioned above. Changing to a heavier grade of lubricant will often improve compression and power in the car that has worn cylinders.

The oil must be kept cool if one wishes to obtain a large mileage per gallon. Not only does cool oil help carry away the friction heat generated in the bearings, but less is evaporated in the crankcase. It maintains more nearly its body and thickness, withstands pressure better at the bearings and more effectually seals the pistons, for, the thicker the oil the better, provided it can get between the surfaces.

No method will effectually improve cases in which oil in the crankcase is unduly heated because of leaking pistons. In finding out if this is the cause, open the breather-pipe cover instantly after a run and while the engine is working. If there is a strong smell of gasoline, or a thin smoke appears, then one or more of the pistons are leaking and this condition is fatal to the miles per gallon of the oil record, for the portion of the exploding gas getting into the crankcase sets up great evaporation and also burns and blows off the oil film around the pistons and rings. The result of course, being that more oil is used and a greatly increased wear of the pistons and cylinders due to a lack of oil.

To overcome these defects the oil must be all drawn from the engine and the engine filled with kerosene below and above the cylinders, the pistons so turned by the crank that all are about midway in the cylinders, allowing the kerosene to remain in the engine for about 24 hours. This will loosen the rings that have become gummed with oil, which is usually due to an inferior quality oil.

Gumming-up tendencies on the part of an oil may be fairly gauged by the use of an inclined plane of smooth iron or tin laid flat on a flat board. An inclination of about one to one hundred will do to start with, but it all depends upon the length of the plane, the smoothness of its surface and the temperature of the atmosphere and the oil.

Take an exact spoonful of the oil to be tested and start it running down the incline, noting the time that elapses before it ceases to run, through the action of the air congealing it. The longer this time the better the oil. Oils will congeal quickly if a mixture of animal or vegetable oil is combined with the mineral oil of which it should be entirely composed.

After the kerosene has stood in the engine for the period designated above, the engine should be cranked briskly a few times and the kerosene drained from the crankcase. Put in a fresh supply of oil and test by running; if not improved drain again, repeating the kerosene process, using a heavier grade of oil, and still a heavier grade if necessary. Run at least fifty miles to test each change fairly.

If the remedy is effected in this way, the oil level or feed will surely need adjustment, and if, in spite of the change of oil, the pistons still allow the gas to pass, the only remedy will be to have the cylinders rebored and new pistons and rings fitted. Do not attempt to waste money in fitting new rings only. If the engine has seen long service the cylinder and pistons have worn oval, not round. Yes, I know that the rings are flexible, but this to a very limited extent, and they will not conform to an oval as bad as found in that particular engine. Very often the new rings will be worse than before, as the old rings have worn so that they are more or less oval.

It will be necessary to change the engine oil whenever it has collected a certain amount of foreign matter which no strainer can keep back. The supply of oil in the crankcase of an automobile in good condition should, if of good quality, easily last 2,000 miles before it needs changing, but conditions and qualities differ so much that no set mileage can be depended upon.

The Heat Test.

A most reliable test for oil is the heat test. Half fill a clean small bottle with the oil to be tested and heat it slowly over a small gas flame until yellow vapor appears above the surface of the oil. It should then be held at this temperature for about twenty minutes and then compared with a similar bottle of unheated oil.

Inferior oil will turn quite black under this test and after standing for thirty-six hours, will reveal a deposit of black, carbon-like sediment that often denotes the presence of acid compounds, which will attack metals and the like. Good oil will only darken a little and will remain quite clear and deposit practically no sediment after standing the same length of time.

The oil strainer, which is usually a perforated or wire screen above the sump, if too large a mesh, will not keep back all the foreign matter which, of course, will be pumped to the bearings with the result already described. If the mesh is too fine the pump may not be able to force up the required amount of oil and the bearings will suffer from lack of lubrication.

Winter is practically here and vaporizing troubles will

Digitized by Google

not be assisted in any way by the fuel that is now supplied. The cold weather in conjunction with present bad gasoline gives a condition that thins the crankcase oil, thus making it necessary to inspect the oil very frequently to prevent the engine "freezing" (the pistons expanding to the extent of stopping the engine) through lack of the proper body of lubricant.

Some manufacturers are advising weekly inspection of the oil in the crankcase, which is a justifiable recommendation, but entails, in most cases, the disagreeable task of getting under the car and removing a dirty mud pan before the crankcase oil can be reached.

Instal a Three-way Cock.

A good way to overcome this trouble and at the same time make it very easy for frequent inspections is to have a three-way oil petcock inserted in a convenient place in the oil line between the pump and the oil gauge. By turning the petcock, to open the outlet into the atmosphere, while the engine is running, enough oil can be drawn out for examination.

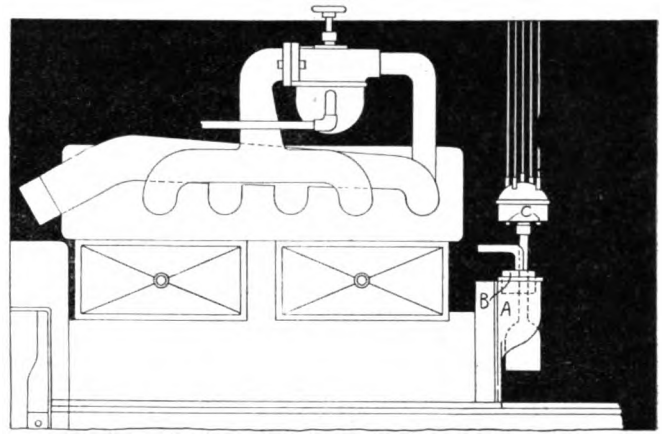
My engine holds about seven quarts of oil in the sump. It uses about a quart every two hundred miles. After a fresh filling I run eight hundred miles, putting in a quart whenever necessary, but at eight hundred miles I stop putting in oil, and run to 1,200. I then have five quarts of oil left in the sump. This I drain out and throw away, replacing with fresh. Thus I always have plenty of clean oil in the engine and do not grind my bearings to bits with the grit worn from them and held in the old oil.

"A waste of time and oil!" you say. Is it? Reader, have you ever looked at oil that has run 1,200 miles? Just take a test tube full of it and let it settle over night. You will find it black from carbon, steel filings and dirt. Dirt comes in through the breather pipe and the carburetor air intake.

In the selection of a suitable oil remember the oils are good, bad and indifferent. Good oil is obtained from any of the well known refiners. In every case I always get what I ask for and also make sure that the seal on the can is unbroken. Practically all good oils are now put up in sealed cans.

And it isn't all in changing oil either. I keep the valves of the engine properly adjusted and ground and thereby save on carbon cleaning. The plugs are clean and the wiring intact. I keep the radiator filled with water and the rubber connections free and open, and know that my engine never runs hot.

I see that the oil pump works perfectly and there's no guesswork in my car as to whether or not my bearings are getting lubrication. These are little points, yes, and all a little trouble. But you, readers, wanted to know where your money goes, and how to save it. I'm showing you.



THE FORD AS A SUBMARINE.

As time passes, one is very apt to come in contact with many interesting things and be called upon to solve many perplexing problems. Everyone who has at any time had anything to do with mechanics or automobiles develops a certain power of reason and ingeniousness. Necessity is the mother of invention.

Not long ago the writer, who also answers many of the trouble department questions, received a letter from a subscriber in West Virginia. This subscriber desired to know how he could "Submarine his Ford." Now Mr. J. P. Hager (for that was his name) was in earnest when he asked the question.

In his business he is called upon to traverse roads of mud and even streams and water of some depth. At this point the writer will pause for a moment to allow the blushes of the West Virginia road commissioners to subside.

The writer pondered the question for some time and gave a few suggestions, a very few, however, for he did not see just how a flivver could be made amphibious. Mr. Hager, ordered by stern necessity, did quite a little brain work and finally solved his problem. The solu-

The Engine After Being "Submarined."

tion, in our opinion, was so ingenious that perhaps other readers will be interested.

He first installed an Atwater Kent ignition system, plugging the holes with cork and using cork or rubber gaskets where necessary. Then he plugged the breather tube with a large cork and fitted it with a small tube, which extended to the top of the engine.

The carburetor was a real problem, but he solved it finely. He removed the intake manifold and turned it bottom side up, as shown in the illustration. In this position, however, the exhaust manifold was in the way, so he procured two pieces of brass tubing (he might have used flexible metal hose) about one inch in length and clamped them between the manifold and the engine block, thus bringing the manifold away from the engine, just far enough to clear the exhaust manifold. Proper gaskets between the manifold and the tubes and between the tubes and the engine made gas-tight joints.

The carburetor he turned right side upwards and since it was above the level of the gasoline in the fuel tank he installed a Stewart vacuum feed system.

The New York Show

THE country at large hailed with delight the announcement that all restrictions had been removed against the holding of automobile shows, but the mental thermometer dropped a number of degrees when the manufacturers rendered a decision against such a display.

New York, Chicago and Boston were hard hit by the last decision, and finally the three cities took the matter into their own hands and formulated a plan whereby the Automobile Dealers' Association could back up the show. That the exhibit is desired has been proven by the great call upon the management for space. We speak of the New York show. Practically every inch of available space was contracted for before the 5th of January and the management at first were at a loss as to how such an enormous show could be staged.

It was finally decided that the show would be divided into two sections. The first would be staged during the week beginning February 1 and ending February 8. This show includes the exhibit of passenger cars and accessories. Following this show upon February 10th to February 15th, the commercial section will be exhibited. This latter section includes the exhibit of motor trucks, delivery wagons, tractors, etc.

Madison Square Garden has about 25,500 square feet of available floor space which is not sufficient to house all of the exhibits and so about 18,000 square feet in addition were obtained by including the 69th Regiment Armory. Notwithstanding this, however, the space was still inadequate, and by rearrangement of the space beneath the balcony in the Armory, room for about four more exhibits was obtained.

The Sixty-Ninth Regiment Armory.

The matter of decorations in both the Garden and the Armory is one to which considerable thought has been given. Two firms of expert interior decorators have been retained to make the setting an attractive one. The adornment of the interior of Madison Square Garden is being entrusted to M. A. Singer, and Joseph S. Petrie has designed a scheme of decorations for the Armory.

The Madison Square Garden as seen from Madison Square Park.

Madison Square Garden is to have a unique color scheme arrangement and the treatment of the balconies is somewhat ingenious. Projecting from the first balcony around the entire arena will be a roof or cornice of Spanish tiles, this cornice being two and a half feet in width and supported by brackets. The tiles will be green and an illuminating scheme will be installed beneath this narrow roof. This Spanish effect will give the first balcony a novel appearance.

The walls about the main arena floor will have alternate paneling and large mirrors which will give the effect of greater area, and the portion beneath the balcony will be illuminated with indirect lighting. The color scheme is cream and white, with certain shades of blue. The first balcony rail or parapet is paneled in artistic fashion, and a series of forty urns filled with plants and ferns rest upon it at intervals.

The pillars which rise to the girders about the Garden will be decorated in blue with white lattice work, and forty-eight old English wrought iron lanterns will hang from them, presenting a quaint appearance. Near the base of each pillar baskets of foliage—hanging vines and flowers—will be placed.

The second balcony is worked out in three shades of

Digitized by Google

blue with white lattice work, and at either end of the Garden will hang huge blue French curtains. Above the second balcony, where the canopy covering the enormous arched roof meets the side walls, a valance of dark blue with huge scallops at intervals and conventional designs of automobile wheels, produces a neat effect. All of the visible walls of the entire building will be covered with buff material or painted in buff tints.

As the visitors enter the Garden they will pass through the lobby flanked on either side by a series of pedestals and pergolas hanging with smilax. The walls of the lobby are latticed, with mirrors alternating, and at the entrance to the arena are three large arched bowers hung with laurel roping and their bases adorned with neatly trimmed bay trees. Straight down the center of the main arena is a series of arches separating the exhibition spaces. At the top of the arches will be shown the name of the exhibitor in illuminated signs.

The exhibition hall of the Garden, which is on the right as one enters the lobby, is a huge bower of smilax which creeps up the latticed pillars and hangs from the ceiling. About the walls are flower boxes with hanging vines. The treatment of the concert hall, which is on a level with the first balcony, is a blue ceiling hanging, with blue French curtains on the walls and large flower chandeliers.

A patriotic color scheme is the keynote of the 69th Regiment Armory decorations. The rear wall of the building will have a sunburst of red, white and blue forming a huge semi-circle. Between the rows of exhibits will extend a wide arbor effect, with trellised vines and flowers. Cypress trees will form a feature of the decorations. From the balconies garlands and floral baskets will hang, and the chandeliers will be clusters of foliage, the illumination being provided by 500-watt nitrogen lamps. Illuminated glass signs will reveal the name of the exhibitor.

At the main entrance to the Armory visitors will pass through an arched arbor and around a fountain made picturesque by bay trees. The walls also will be trellised, and under the balcony there will be a pergola ceiling which will make the accessory booths attractive. The semi-circular girders of the roof will be concealed by a huge canopy of blue bunting. Outside the building at both the Lexington Avenue and 26th Street entrances will be large electric signs.

The Armory is to contain one of the most interesting passenger car body displays during the first week and commercial body exhibits during the second week. A number of the expensive passenger cars which formerly were exhibited at the Automobile Salon in the Hotel Astor will be in the Armory, and there will be some fine examples of custom bodies and rich coach work, as well as the regular stock bodies. Applications for space in either or both sections of the show may be made with the Automobile Show Committee, Hotel Woodward, Broadway and 55th Street, New York City.

THIS MAGAZINE AT THE AUTO SHOWS.

The Automobile Dealer and Repairer magazine will be represented at the New York Automobile Show in the passenger car section in the booth at space 371 and 372, located on the Balcony of the Madison Square Garden. This booth will be in the charge of Geo. A. Smith, our Eastern representative.

At the Chicago Show, Passenger Car Section, the space allotted is number 10, Coliseum Gallery. In charge of this space is our Western representative, H. F. Ludington.

We extend a cordial invitation to all our subscribers, advertisers and friends, to look up our representatives and introduce themselves. It is a good chance for us to meet each other, and cement our relations with friendship.

The Chicago Automobile Show.

The Chicago Automobile Show to be held by the Chicago Automobile Trade Association, beginning January 25, bids fair to be well patronized.

At the first allotment of space in the passenger car section of the show 137 spaces were taken by 81 applicants. In the commercial car section, 74 spaces were distributed to 34 applicants. At the time, about 30 applicants in addition were awaiting allotments. The passenger car section and accessories exhibition will be held beginning January 25 and last until February 1.

Immediately following this will be staged the commercial car section, beginning February 3 and ending February 6. Mr. Sam A. Miles, who formerly had charge of the shows for the National Automobile Chamber of Commerce, stages the present Chicago show. The decorations were planned before the War Industries Board forbade the exhibition and these decorations will be used.

Newark's Show.

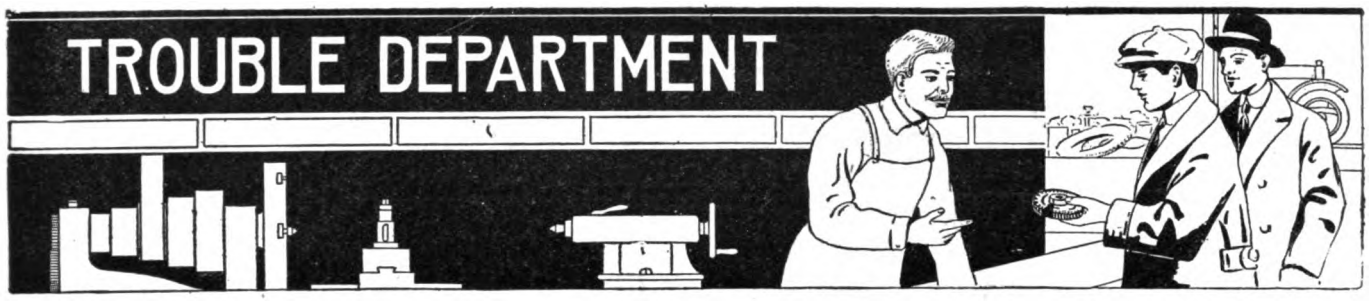
THOSE who appreciate the value of the motor car in every walk of life and the people who have denied themselves the privileges of owning an automobile since the day that war was declared, will once again have the opportunity to arouse their motor interests.

With the dawn of peace came the desire to see what the motor car industry has to offer after its months of speeding up, improvements and lessons learned from meeting the demands of the Gods of War.

These desires can be satisfied in the near future in the city of Newark, where the motor car dealers are preparing for the greatest display of passenger cars, commercial cars, trucks and truck attachments and accessories that New Jersey motorists have ever inspected.

The New Jersey Automobile Exhibition Company has planned to make this a record-breaking event in every way as a fitting celebration of the return of the motor car industry to peace-time activities.

The First Regiment Armory, Sussex Avenue, will be



Digitized by Google

beautifully decorated, and judging from the applications for space that have piled up on Show Manager Claude E. Holgate's desk, there will be few feet of floor space not occupied by a motor car.

Mr. Holgate announced that never in the many years that he has been associated with New Jersey motor car interests has there been such rivalry for show space among the dealers and keen interest among people who seem to be prospective buyers.

Every day telephone calls come from people in no way connected with the motor car industry, asking when the Newark show will be held. From this it is to be construed that prospective motor car buyers are awaiting the opportunity to inspect all the leading makes of cars and trucks under one roof.

If any readers are among such prospective buyers they should mark down the dates of the coming event, February 15 to 22.

Notice to Our Readers.

WHILE we try to answer all letters received, we dislike to publish certain information of a more or less personal nature, or information which is not of interest to our other readers. Names of manufacturers and addresses which only fill space in our columns, we prefer to send by personal letter, simply because we feel that the space should be devoted to correspondence of interest to the largest number of our readers. For these reasons we ask that anyone wishing information through this department shall sign his full name and address. If requested, the letter or question will not be printed in the magazine, but answered direct by mail.

Since this department is carried on for the benefit of many, we prefer to publish all interesting letters. If requested, or if in our opinion the subscriber prefers to keep his identity secret, we will use only initials or a pseudonym.

All letters are answered either directly by mail, or published in these columns. Often we adopt both methods. If you do not receive a reply within a reasonable time after writing us, send us another letter. There seems to be confusion in the mails and often letters are lost.

2581 Broken Battery Cell.

From Frank Davis, Illinois.—Will you please tell me, through the Trouble Department, what, if anything, can be done to keep two of the cells of the storage battery on my car from discharging? The third cell remains charged.

I have used the car four summers, and this is the third battery. During the life of the first two batteries (16 months each), I did not have any trouble with them.

Each time I have had the present battery charged, two of the cells have been entirely exhausted while the third cell showed a gravity reading of 1.250.

The generator seems to work just as well as ever, and the current indicator indicates "Charge" at all times when the car is being driven more than eight miles per hour.

Reply.—At first consideration we are inclined to think that the cells of your battery have been cracked and allow a slow leakage of the electrolyte. To make up for this leakage you have added distilled water, consequently the hydrometer reading has dropped steadily. A new cell is the only cure for this trouble. The battery man will be able to remove the plates from one cell and put them into a new one at comparatively low cost.

If this is the trouble, you should have noticed that the two cells in question required more water than the other. If this is not the case look elsewhere for trouble.

Very frequently the heavy connections or wire terminals drop across the cells in such a way as to short circuit them. In the same way it is possible that the battery terminals rest against the frame, the metal part of the seat, the springs in the cushion, a loose wire or in fact any metal piece. Be sure that no metal touches the battery, aside from the lead wires.

Keep the top of the battery clean and dry. Be sure that the battery is firmly anchored in position, it may jounce and hit against a metal part of the car.

Failing to find such trouble outside the battery, call the attention of the battery man to the trouble. See that the electrolyte is kept at the proper level. It is very possible that there is an internal short circuit. Only the battery expert can repair it.

Obtain an ammeter and put it in place of the present current indicator, temporarily. That is disconnect the two wires from the current indicator and connect them with the ammeter in such a way that when the lights are on and the engine quiet, the ammeter will point to the "Discharge" side. Turn off all lights and start the engine, note the ammeter reading at a car speed of ap-

Digitized by Google

proximately 15 miles per hour and write us, giving us this information, if you do not locate the trouble. Please send us your full address.

Timing Valves Properly.

2582

From J. H. Fleege, Wisconsin.—Will you kindly tell me how to time the valves on my two cylinder opposed engine? I have removed the timing gears and though there are marks on the flywheel, I cannot seem to make the valves come right.

Reply.—Since you did not tell us the make of your engine, we cannot give you a definite valve setting, but you should have but little trouble finding the proper valve position.

The flywheel, if it is marked, may have a great number of letters upon it. First turn the flywheel over until the piston in number one cylinder (at the right when sitting upon the driver's seat) is at the extreme top of its stroke.

Examine the flywheel at this point. You may notice a mark at the extreme top, on a line with the center of the engine, or beneath an indicator, if there is one. This mark will be identified by the letters D. C. or the letter C. If there is no such mark, turn the flywheel until the piston in number two cylinder is at the top of its stroke.

When you have located this dead center mark on the flywheel, continue to turn the flywheel for about one inch until a second mark appears. This mark is lettered E. C. (probably), and indicates that the exhaust valve, in the cylinder of which the piston is near the top, should close. Put this mark beneath the pointer and then turn the camshaft in its direction of rotation (opposite to the direction you turn the crankshaft or flywheel). Place a thin piece of paper between the tappet and the valve of the cylinder you are trying to set.

Now continue to turn the camshaft in its direction of rotation until the valve has opened and nearly closed. As soon as you can pull out the paper, put the camshaft gear into place and mesh it with the crankshaft timing gear.

If there is no mark E. C. on the flywheel, you will probably find a mark, about 1¼ inches past the D. C. or C. mark which is lettered I. O. (inlet opens). Place a piece of paper between the inlet valve and tappet of the cylinder you are working upon, and turn the camshaft until the paper is gripped by the tappet against the valve stem. The gears should be meshed, the instant that the paper begins to be pinched.

If there are no marks on the flywheel which seem to give the proper setting, you can make the following experimental setting. Turn the engine over, until the piston in number one cylinder is at the top of its stroke. Make a chalk mark upon the flywheel, beneath or behind some convenient marker or identification point.

Now turn the flywheel, in its direction of rotation, until this mark is 135 degrees from its original location (135 degrees corresponds to the location of the minute hand of a clock at 22½ minutes past the hour).

At this point, set the exhaust valve in number one cylinder so that it will start to open, using the paper and meshing the camshaft gears as soon as the paper is gripped between the tappet and the valve stem.

This is only a trial setting. Turn the flywheel until the piston is again at the top of its stroke (end of exhaust) and note the point where the exhaust valve closes. The exhaust valve should not close before top center. It probably will close slightly past. If it closes before top center, remove the camshaft gear and turn the camshaft until the valve closes.

The inlet valve will open about five degrees after the exhaust has closed.

Grounded Timer Wire.

2583

From W. Stallings, Illinois.—I have a Ford car which is giving me considerable trouble. When I first purchased it, two years ago, the wrist pin bushings in the piston were not put in at right angles to the piston, consequently the piston scraped against the cylinder walls at the top and on the other side at the bottom.

It was some time before this trouble was found and eliminated. The repairman installed oversize pistons (.0025). Now this engine heats very badly and the water boils in two or three miles of running, consequently the engine then begins to pound.

Everything seems to be in good condition, the valves have been reground and the carbon removed. What can be done to prevent overheating?

There is something wrong with the ignition system, the coil for number four cylinder buzzes all of the time. I have changed coils but no matter which coil is used, that one in number four position will continue to buzz as long as the switch is on.

Reply.—Probably if you locate the ignition trouble, you will have found the cause for engine overheating. The wire which leads from number four coil to the timer is grounded, at the timer, or within the cable from the coil box to the timer. Replace all of the wiring with new if you cannot locate the trouble. Perhaps one of the headlight wires has "shorted" inside the covering and is connected with the timer wire. If the trouble is not in the wiring examine the porcelain post on the coil box. This may be connected with a metal part, possibly the battery box itself.

When you get all four cylinders running and prevent the fourth coil from buzzing all of the time, if the engine still overheats, clean the cooling system.

For this purpose, use a solution of potash lye and water, or washing soda and water. Follow the direction given in answer to question number 2572, page 61 of the December issue. If you still have trouble let us hear from you again. Tell us at what point in the piston travel the exhaust valve in number one cylinder closes.

Installing Stewart Vacuum System.

2584

From A. L. Cleland, Ohio.—Can I successfully install a Stewart vacuum system on an automobile which has a gasoline tank located in the dash?

Reply.—You cannot install this system if at any time the gasoline level in the big tank is above the top of the vacuum tank air inlet. If you install such a vacuum system under these conditions, immediately the air inlet valve of the vacuum tank opens the gasoline will begin to siphon from the big tank and will flow from the air inlet until the level is lowered to that of the air tube.

The vacuum system is simply a device which draws out the gasoline from the supply tank and holds it in a small auxiliary tank from whence the fuel flows to the carburetor by gravity feed. We can hardly see the reason for such a system when the gasoline tank is in the dash above the carburetor level.

If, however, you can place the vacuum tank above the level of gasoline in the big tank you can make it work satisfactorily.

Transmission Gears Grind.

2585

From W. H. Swetnam, Kentucky.—I own a Willys Knight car, 1916 model, and experience considerable difficulty in changing from high to second or from second to low speeds. In making either of these changes, I am obliged to almost stop the car, to prevent the gears from grinding. The car, otherwise, seems to be all in good condition and I fail to understand the reason for this trouble.

Reply.—The trouble is not in the transmission, but in the way in which you change the gears. When you shift from high to neutral, in making the change, let in the clutch for a second and tap your foot against the accelerator, then throw out the clutch and shift to second speed. The idea is to increase the speed of the clutch shaft, to correspond with the speed of the second sliding gear.

If you will refer to the November Automobile Dealer and Repairer, you will find a page article on this same subject, written by F. L. Phillips and produced on page 47.

Batteries in Winter Storage.

2586

From S. G., Pennsylvania.—Will you kindly send me information relative to the care and charging of storage batteries which are to be put into winter storage?

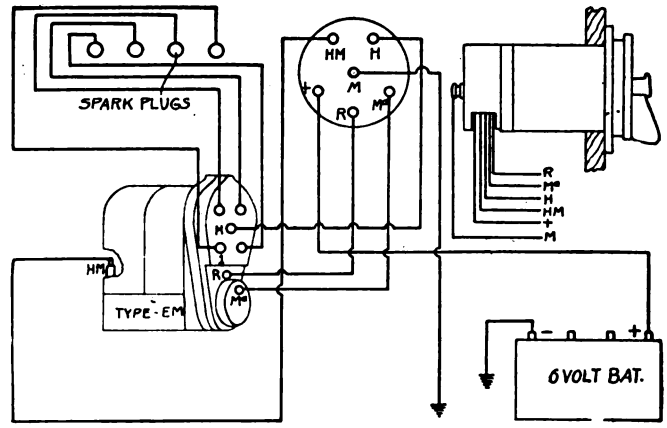
Reply.—When charging storage batteries for winter storage no special attention is necessary above that ordinarily given.

Before putting the battery away for the winter, give it a long slow charge until it gases freely. The charge should be carried on at the 24-hour rate. After being sure that the battery is fully charged, it may be put in a room in which the temperature does not drop below 50°. The battery should be tested about once a month, and unless there is something the matter with it, the first charge will last until it is ready to be placed upon the car again, when it should be given another charge at the 24-hour rate.

You will probably be able to get better results if you partially discharge the battery before giving the charge in the spring.

Removing Battery Stains.

2587



From T. N., New York.—Will you kindly inform us as to how the acid stains from a storage battery can be removed from upholstering fabric in a limousine car?

Reply.—As a matter of fact, that which you term a "stain" is not a "stain." The acid has removed the original color from the cloth, possibly has removed a portion of the fabric as well, by strong sulphuric acid action. There is no way that the apparent "stain" can be removed.

Wiring of Eisemann Magneto.

2588

From H. McFarnan, South Dakota.—Will you kindly give me a diagram showing how to wire an Eisemann magneto to a Ford engine? This magneto is type EMJ-R4 of the dual type.

Wiring Diagram of Eisemann, Type E M 4, Dual Magneto with Coil and Markings.

Reply.—We give you herewith wiring diagram of an Eisemann magneto and coil.

Difficulty in Starting.

2589

From G. R. Polzer.—Can you tell me why I cannot start my car with the hand crank? Last spring I did not have this trouble, but now the car is extremely difficult to start. It is fitted with a Dixie magneto and runs nicely after it has once been started.

Reply.—We should advise you to clean the Dixie magneto, paying particular attention to the safety spark gap. Be sure to remove all dirt and grease from the working parts and the high tension connections.

Digitized by Google

His Engine Overheats.

2590

From F. I. Pickering, Texas.—Will you kindly answer the following questions in your Trouble Department?

(1) What is the probable cause of the water in the cooling system of a car (pump circulation) boiling while the motor is laboring on heavy pull and car speed about ten miles per hour? The car in question that does this began to act this way after it had been run about 2,000 miles; radiator not touched during that time nor carbon removed. The piston rings allow oil to slip past them into combustion chamber as shown by blue smoke of exhaust when motor is speeded up. The hood has no ventilating openings in its side and the thermometer down here in the summer time registers pretty high. My supposition first was that the radiator was clogged. I then ran lye water through it but no improvement noticed; next I used washing soda solution the same way but that don't seem to remedy it; then I removed the most of the carbon (I believe) but still it heats although I believe the carbon is the main cause. Am I right?

(2) Will one over-size tire on one of the rear wheels have any material effect on the wear of the differential? I have heard that it would. What about a tire "half-soled" or with a tread sewed on—"double-treaded?"

(3) What is the fault of the carburetor adjustment when the motor chokes up and almosts dies entirely when the throttle is suddenly opened wide?

I would like to add that I have connected up a "gas saver" by putting in a three-way connection in the lead from the dash gasoline tank to the intake manifold and running a pipe line from the third opening of the connection to the dash. At the dash I have a pet cock installed and which I open for additional air. The noise is somewhat objectionable but the most important use of this is to give the motor a dose of *hot* water, that is, when the motor is hot I take some hot water and allow the motor to draw in the hot water a little at a time through this above mentioned pet cock on the dash by means of a rubber tube, while the motor runs at a fair rate of speed. If the motor is hot and the water used likewise, the result is the entire elimination of carbon except that which has been incrusted on the piston heads for a long time—and several or frequent doses will remove this. I have tried various carbon remover solutions but like the water method best. I used the last mentioned method once only and then examined the firing chambers of each cylinder and notice that the carbon on the piston heads was soft and could be rubbed off with the fingers and the valves were as clean as though they had just been placed in the motor. It would be better to have the petcock close to the three-way connection and operated by a Bowden wire from the steering column but I could not do that on my car.

Reply.—The cause for engine overheating may be due to carbon, insufficient valve opening, retarded spark or clogged exhaust line. Your supposition regarding the carbon is probably correct.

One over-size tire, a tire half-soled or double treaded would cause but little additional wear upon the differential. This uneven wear might be stated to be about one part in ten thousand—it would be negligible.

Engine chokes up upon sudden acceleration only if the high speed nozzle is too large, permitting too great a supply of gas at high speeds—or, in other carburetors because the auxiliary air valve does not open sufficiently or easily enough to permit the entrance of more air at higher speeds.

Your suggestions relative to the pet cock are good and deserve the attention of our other readers.

A Broken Condenser.

2591

From A. A. Oesterling, Pennsylvania.—I have a 1914 model Oakland car, equipped with a Delco Junior 1914 starting, lighting and ignition system. Lately I have had trouble with the contact or breaker points. They would fuse together and corrode very rapidly. I have replaced them many times, and had them carefully adjusted by a service station man. Do you think that the points are too soft?

Reply.—We are of the opinion that the whole trouble is caused by a faulty or short-circuited condenser and would suggest that you have this unit tested by the garageman. If there is a Delco or Klaxon service station in your town, have them replace the condenser with a new one.

Attention, Readers!

2592

From C. T. Stevenson, Minnesota.—I have a King, Model D, 1916 car, fitted with a Ward-Leonard starter and generator. Is there any way that I can run this car without the storage battery?

Reply.—As a general rule, a car should not be operated without the storage battery. There is danger that the generator will be burned out. If, however, you care to go to the trouble of making the following experiment, you can use the car safely.

Open the cover above the commutator of the generator and remove the brushes from their cases, or tie the brush holders away from the commutator. Be sure that the brushes do not touch the commutator, or the machine may be damaged. This same rule works out for practically any type of generator.

Dry batteries may be used for ignition purposes while the storage battery is not on the car.

A Remedy for Piston Slap.

2593

From a Subscriber in Washington, D. C., who has written on a Bureau of Supplies and Accounts letterhead. Letter is unsigned. I have a 1918 Chandler car,

Digitized by Google

in the engine of which there is a decided rattle. The repair man recently installed new rings at the top of each piston, but the noise still remains. The repairman tells me that it is due to piston slap.

Will you please give me a remedy for this trouble, other than the reboring of the cylinders or the renewing of the pistons?

Reply.—Under ordinary conditions, if the cylinders have not been worn excessively, a complete set of leak-proof rings will remedy the trouble. If the pistons are not fitted with a ring below the wrist pin, install such a ring, that is if there is sufficient metal in the skirt of the piston to permit the installation.

A Studebaker Car Query.

2594

Will the subscriber who signs himself F. P. kindly forward his full name and address? This subscriber asks a number of questions relative to a Studebaker 1915-1916 car and wishes the addresses of a number of manufacturers.

Piston Slap.

2595

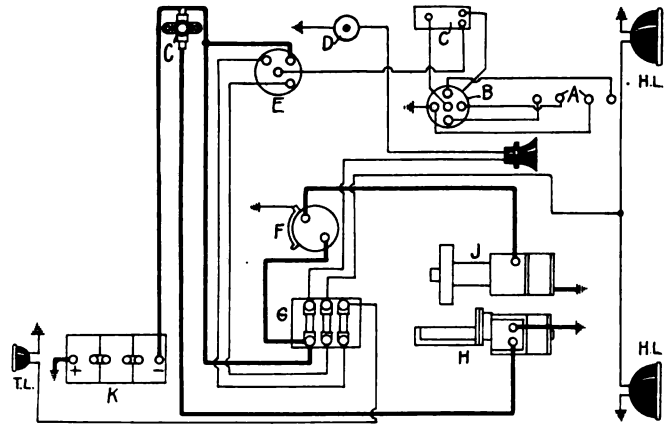
From J. F. Indra, Iowa.—I have a Ford car which is about three years old and has been operated only about 1,000 miles. There seems to be a knock in the engine and has been for some time. Last spring I had the car overhauled, but the knock re-occurred after a short time. The connecting rods are tight and the wrist pin bushings are practically new. A number of garagemen have told me that the knock was caused by piston slap. At any rate, when a heavy oil is used, or when the spark is retarded, the knock decreases in volume. The knock is more noticeable when the car is being run on level ground.

Reply.—Since you are sure that the connecting rods and wrist pins are tight, in all probability the knock is caused by piston slap. We arrive at this conclusion because you say that the knock is less noticeable when heavy oil is used.

We should advise you to have the cylinders rebored or reground if they are round at the present time, and install oversize pistons. For this machine, the pistons should be .004 of an inch smaller in diameter than the cylinders. Be sure to fit the rings by the Prussian blue method.

2596 Removing Spring Leaves.

From R. F. Talbot, New York.—I own a model 86 Overland car which is fitted with a special roadster body. This body does not seem to be heavy enough for the present springs. Would you advise me to remove any of the spring leaves?



Reply.—If the springs on the car at the present time are too stiff for the weight carried, new ones of a lighter type should be put in place. If you should remove any of the spring leaves, the load will not be distributed evenly upon the remaining leaves.

An automobile spring may be compared to a stone arch bridge. So long as every stone is in place, the unit will support many tons. Remove one of the bricks or stones, however, and the whole thing will crumble. Each leaf of a spring is slightly lower than the next one above it. The thickness of the spring itself is designed and depends upon the one above it. Though it is possible that the removal of one of the leaves would not destroy the spring, still there is great danger that the spring will be weakened and snap apart.

The cheapest thing you can do, in our estimation, is to install a new spring. If, however, you decide to remove any of the leaves, remove the second from the top. If you remove more than one, remove the top one and the third one.

2597 Wiring of Saxon Car.

From A. B. Schooley, Pennsylvania.—Will you kindly give me a wiring diagram of the Saxon car, 1916 model? Will you also show in the diagram where an ammeter can be attached? The generator does not seem to keep the storage battery charged, although I have had both

Wiring Diagram of Saxon 1916-17 Four Cylinder Car. A, Spark Plugs; B, Timer-Distributor; C, Coil; D, Horn Button; E, Ignition and Lighting Switch; F, Cut-Out; C, Fuses; H, Starting Motor; J, Generator; K, Battery.

units overhauled and they are supposed to be in good condition. Is it possible for me to adjust the generator so that it will give more current? Is it possible for me to run the car without the storage battery?

Reply.—We give you herewith a diagram of the Saxon 1916, four-cylinder car. This machine was fitted with a Wagner generator and Detroit starter. The ammeter connection is shown.

Be sure to insert it in the line at the exact point shown in the sketch. There is no way that you can change the charging rate of your generator. This unit should keep the battery charged at all times if the wiring is correct.

However, about every six months the battery should be charged at a charging station. There is no way that you can operate the generator with the storage battery disconnected, without taking a chance at ruining the

Digitized by Google

unit. If you are having trouble with the generator, that is, if it does not seem to furnish enough current, perhaps the wiring is at fault. In any event, we should advise you to rewire it, being careful to use the same sized wire as originally used throughout the machine. If the ammeter indicates a charge of four amperes or over, the amount of current passing into the battery is sufficient, otherwise return the generator to the service station for repairs.

If the ammeter indicates charge when the engine is stopped and the lights are on, reverse the connections. It will then register correctly.

Spark Intensifiers.

2598

From George Cary, Mississippi.—I would like to tell the readers of my experience with spark intensifiers. I have an engine in which the two front spark plugs carbonized very rapidly. This fact bothered me a great deal, until I installed two spark intensifiers, one at each plug. Now the plugs remain clean at all times.

Reply.—There is one little point about spark intensifiers which we can suggest to you. You may find trouble in starting the car while these are being used, but you can obviate this difficulty by "shorting out" the intensifiers. As soon as the car is started remove the short circuiting wire and the car will run smoothly with the intensifiers.

A Tractor Question.

2599

From Frank Johanneck, Minnesota.—The cylinders in my 30-60 tractor are worn about 1/16th of an inch out of round, and I would like to make them last until another fall without reboring them, if possible. Would you suggest that I place all of the piston ring joints at the bottom of the pistons? The cylinders are horizontal and it is my idea that if the joints are all placed at the bottom since the ring hugs the lower portion of the cylinders, these joints will not be at the point where leakage is greatest.

Reply.—We would not advise you to place all of the piston ring joints at the bottom of the cylinders as you suggest, for the reason that there will surely be considerable gas leakage through them. We would advise you to adopt the following method if you do not want to have the cylinders rebored:

Space the joints in about quarters around the piston, that is, the top ring joint is at a certain point, the next joint to it is the second ring, will be about one-quarter of the circumference; the third ring joint will be about one-quarter of the circumference away from the second, and the fourth one, one-quarter away from the third. After they have been located, drill a 1/8 inch hole in the piston so that one-half of the hole is in the ring, and the other half in the corner of the piston groove.

Drill this 1/8 inch hole so that it comes just to the bottom of the piston ring, then drill a 3/32 inch hole, using the same center through the piston, and drive into this second hole a small pin, riveting it over so that it cannot slip out. Cut the pin off so that the end is just below the surface of the piston.

Do this for each ring, then fit each ring to the cylinders. Use a new ring in each case and scrape it in by the Prussian blue method, being careful to scrape it into the position in which it will be located after the piston is in place. This is the only way that you can fit the rings and get satisfaction.

Charging Battery from Ford Magneto.

2600

From J. E. A., Canada.—Will you kindly tell me if there is any way that I can charge a storage battery from a Ford magneto, and if there is, send me a wiring diagram?

Reply.—It is impossible for you to charge your storage battery from the Ford magneto by any practical method. The Ford magneto generates alternating current, and should you connect your battery with it, you would ruin both the battery and the magneto within a few minutes. A storage battery must be charged from a direct current line. The amperage used should be about 4. The voltage matters but little. It must, however, be direct current.

A Click in the Oil Pump.

2601

From Otto Dieter, Missouri.—I have a Regal Model E light 4 car in which there is a peculiar click. I am fairly sure that this click is located in the oil pump and think that it is caused by the small steel balls which act as check valves. I removed these balls and replaced them with balls made of fiber. This change seemed to eliminate the click partially, but not wholly. What do you think may be the cause of this, and how may I remedy the trouble?

Reply.—We doubt very much if the click is caused entirely by the two ball check valves, but are inclined to think that the plunger does not fit the housing properly, or that the end of the plunger is worn. Remove the pump and examine this unit. If there is a spring in it which returns the plunger to its proper place, replace the spring with a new one.

There are a number of other possibilities for trouble. First, it is possible that the pump is not fastened tightly to the crankcase. Again, it is possible that the plunger fits the housing too tightly, or binds at a certain point. In this event, it would not follow the cam as the cam revolved, but would snap against the cam every revolution.

If you still have trouble let us hear from you again, and we will advise you relative to altering the check valve arrangement. We do not want to do this until you tell us whether or not the device is furnishing sufficient oil.

Rayfield Resumes Production

Our war work is now almost finished. Shipments of Rayfield Carburetors are increasing daily. Soon we will be up to schedule on the world's most efficient carburetors for passenger cars and trucks.

Warm up your motor quicker

Rayfield Motor Thermostat

Interior view showing operation of valves

Every motorist has experienced the difficulties of winter driving. When the motor is cold it will continue to miss. It will not accelerate. It has no power.

The installation of a Rayfield Motor Thermostat causes the motor to heat up quickly, and maintains a constant efficient temperature at all times. If the car is stopped, the engine remains warm for a greater length of time. This greatly facilitates starting and gives a quicker acting motor. In fact, it assures the same motor efficiency in winter as in summer.

The Rayfield Motor Thermostat is different in operation and construction from any other device of its kind. When water in motor is cold the main valve is closed, which prevents circulation through motor block. This permits motor temperature to rise to the point of maximum efficiency within a very few minutes in the coldest weather.

In motors with pump circulation the pump pressure is relieved by by-passing the water from delivery end of pump through by-pass valve and into the radiator. Complete circulation of water through the radiator is thus maintained at all times. This overcomes, to a great extent, the common difficulty of water in the radiator freezing before circulation begins.

When water in motor block reaches a temperature of 170 degrees, its action upon diaphragm of the Thermostat causes it to expand and gradually open the main valve. This action also slowly closes the valve of the by-pass connection. The diaphragm is sensitive to any variation of water temperature and will open or close main valve as required. In this manner a constant, efficient motor temperature is maintained.

For thermosyphon systems the price, including all fittings, is $15.00. For pump circulation systems the price, including all fittings, is $17.50. Installation is simple. Your own garage, or dealer, can handle it for you.

NEW AND INTERESTING THINGS IN MOTORDOM

Main Bearing Aligning Reamers.

Automobile manufacturers have been able, since the advent of the Martell Reamer, to save much time and labor—and consequently money—in reaming all the main engine bearings and eliminating "Hand Scraping" simultaneously. Now it is possible for the repair man and machine shop to derive the same benefits by the use of the Martell Aligning type Reamer, which accomplishes these three essentials of a satisfactory job:

(1) Perfect alignment through all bearings.
(2) Correct position of shaft in relation to other shafts or parts dependent upon it for motion.
(3) Correct size of bore of bearing, allowing for oil clearance.

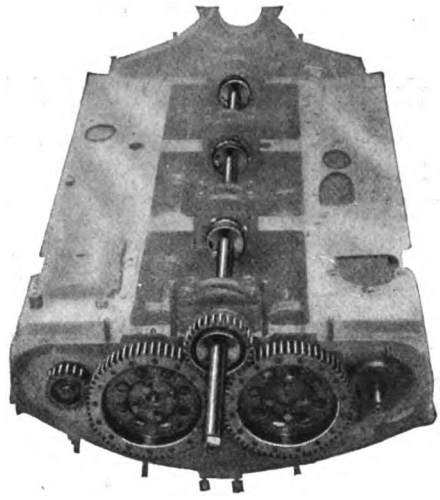
Moreover, all of these results are easily accomplished at a saving over hand scraping of from 50% to 90%.

The Reamer Set consists primarily of one shaft with one or more Reamer Heads and a number of supporting bushings used to properly center the bar before the reaming operation is begun. These supporting bushings each consist of two eccentric sleeves held in a conical sleeve, the conical portion of which is provided with a fine pitch thread.

The complete supporting bushings are screwed securely into the soft metal of the bearings to be reamed, and the eccentric sleeves adjusted until the reamer bar is in the desired position and perfectly aligned through all bearings.

Lock screws and bolts are provided for properly maintaining the correct setting.

A zero mark on the faces of the eccentric sleeve flanges shows the central or concentric position of the eccentric sleeves. The drawing shows these features in detail.



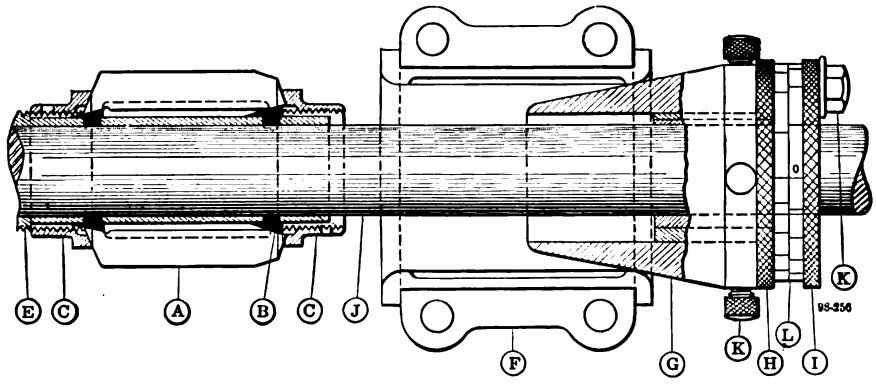
The Reamers, as will be noted, are of the inserted blade type, the blades being expanded by means of cams or wedges, and a front and rear adjusting nut.

The ends of the blades are ground accurately to the same angle as that of the adjusting nuts, and as all actuating parts are carefully hardened and ground, extreme accuracy of adjustment is obtained.

Owing to the construction of the supports for the reamer bar, no strains are imposed on the crank case, nor is there a tendency to distort it, since these supports are secured to the bore of the bearings and have no attachments to any other part of the crank case.

The tapered portions of the supporting bushings, screwed firmly into the ends of the bearings, tend to seat the bearings securely into the case and cap. A very desirable feature.

This equipment will produce bearings that are exactly in line. Furthermore, it is claimed that the bearings will show a greater area in contact with the shaft than those scraped by hand because the supporting bushings, acting as guides, compel the reamer to revolve in a true circle.



A Martell Aligning Reamer, Showing the Crankshaft Gear Mounted on a Special Bushing on the Reamer Bar, to Secure Proper Gear Mesh.

The superiority of this method to hand scraping is apparent when it is considered that perfectly aligned bearings will give more satisfactory service for a long period than hand-scraped bearings, for since the alignment is perfect there is no tendency for the crank shaft and bearings to work against each other. The shaft, of course, must be straight. The point has often been brought up that if a crankshaft is not straight the bearings should not be in line by an equal amount in order to accommodate the error. Suppose a crankshaft line of bearings is reamed out of line .002 to allow for the same error in a crankshaft. When the shaft is revolved 180° the error is not reduced but is really doubled. It, therefore, is apparent that perfectly aligned bearings give the least strain in all directions.

Crankshafts, therefore, should be straightened. The most important point is that the high cost of hand fitting may be eliminated almost entirely. It is also a proven fact that perfectly aligned bearings have the very beneficial effect of reducing vibration.

The whole construction of this device is very simple, the design and accuracy of workmanship being responsible for its great efficiency.

These equipments are made in two sets, No. 1 covering 3 or 5 Bearing Motors and No. 2 covering 4 or 7 Bearing Motors. Blades for diameters of 1¾ inches to 2⅜ inches are carried in stock and one reamer of any one size will be furnished with either No. 1 or No. 2 sets. Additional blades for different diameters can be purchased at a nominal price.

Luverne Truck Parts.

We know from actual experience that there are thousands of shops throughout the United States who have the necessary equipment and help to enable them to build motor trucks and to convert passenger cars into motor trucks for the trade in their local territory on a basis which will furnish their customers with the maximum of truck value and service, and at prices which will easily meet outside competition and enable the concern to become an actual motor truck factory with a permanent and profitable future.

To operate successfully and on a small investment it is necessary that these local truck factories have access to a supply of truck parts which they can get promptly and in small quantities as needed, and the Luverne line of truck and truck unit parts is offered to the trade to meet this demand.

The Luverne line of truck parts are furnished in several sizes suitable for trucks and truck units of from three-quarters to three ton capacity, and consist of axles, wheels and tires, frames, fittings, springs, motors, transmissions, bodies, cabs, hoists, etc.

All parts are complete in themselves, ready to assemble and are sold either in complete sets or as separate units.

The Luverne line of parts is also well adapted for the export trade, for foreign firms who are in position to assemble the parts, and build bodies and equipment locally.

Dwyer Bevel Glass Back Curtain.

One of the simplest ways of adding distinction to the standard Ford equipment is provided by C. Marville Dwyer, 114 West Washington, Los Angeles, who is manufacturing and marketing the Ford Bevel Glass Back Curtain.

The Dwyer curtain is three thicknesses of standard Ford curtain material, corresponding in appearance with the balance

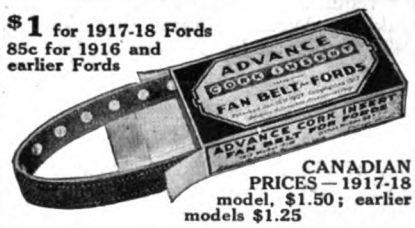
Over 500,000 Ford owners are using Cork Insert

A year and a half ago we told you what Cork Insert *Would Do*—today we tell you what it actually *Is Doing* for over half a million Ford owners.



For over 500,000 users, Cork Insert Transmission Lining is giving smoother starting and stopping cars. It has eliminated chatter. It has made the brakes SURE. It has stopped the racking vibration of stopping. On top of all this, it is giving wear several times as long as that of ordinary linings, and saving the cost of frequent replacements.

The secret of the phenomenal success of Cork Insert is the successful combination of cork with cotton fabric. Buttons of cork are set into highest grade fabric. The corks provide *sure* friction. The lining provides the strength to hold the car and protects the corks. *The combination* makes the finest working, longest lasting lining ever produced.

Every Accessory dealer and garageman handles Cork Insert or can get it within a very few hours — for EVERY JOBBER CARRIES IT IN STOCK.

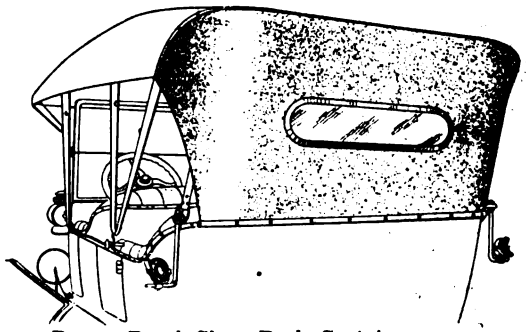
Cork Insert Fan Belt for Fords



Retards overheating by keeping the fan fanning. Most motor trouble is caused from overheating. This is due in no little degree to loss of driving power—estimated as high as 25% to 50%—because ordinary fan belts slip and stretch. Cork Insert Fan Belts stop the slipping. It doesn't have to be run tight to prevent slipping, like ordinary belts. This, plus its durable construction, means extra long wear and economy. Cork Insert Fan Belts outlast all others—hence economical.

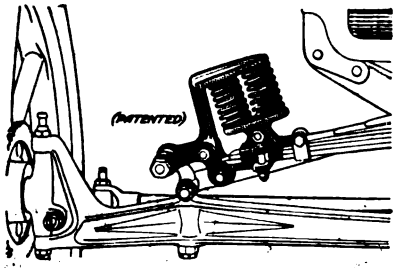
cars but is furnished in any size and any weight and kind of goods to fit various cars.



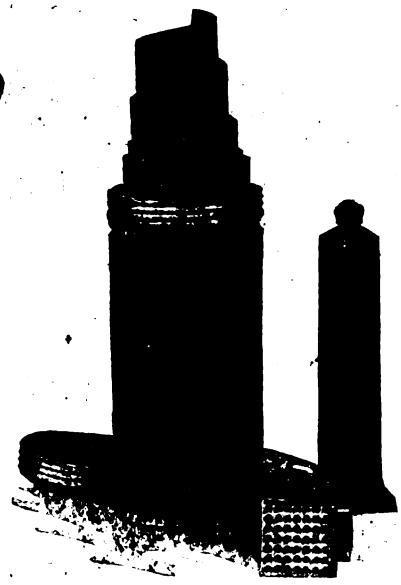
New Prices on Kerosene Engines.

Those who are thinking of buying a farm engine will be interested in latest prices on the Witte—the better quality engine—longest on the market, easiest to use, fuel-saving, reliable. As usual the Witte factory offers the most favorable prices to the customer, and now as before the war, and during the war, buyers can buy on practically their own terms. Every Witte Engine—gasoline or kerosene—is sold on a valid five-year guarantee backed by the largest exclusive engine factory in the world selling direct to user. A handsome new engine catalog, and big illustrated folder, showing what Witte users are doing, together with latest prices, mailed free on request to Witte Engine Works, 2492 Oakland Avenue, Kansas City, Mo., or to 2492 Empire Bldg., Pittsburgh, Pa.

Champion Shock Absorbers.

The Champion Shock Absorber Sales Co., of 918 North Senate Avenue, Indianapolis, Ind., manufacture a shock absorber of considerable merit. This device is designed primarily for Ford cars and consists of a unique lever combination of coil springs, and castings.

To the axle housing is attached an inverted L shaped casting and hanging upon the lower end of this casting upon a mov-



A Champion Shock Absorber.

able pivot is the car spring. The L shaped casting itself is free to swing vertically.

Between the L shaped casting and the spring are mounted two heavy coil springs. One can see, therefore, that two systems of levers are used, which tend to reduce the vertical body movement and to convert it to sidereal motion. The springs tend to absorb shocks and rebound. The shock absorbers are easy to apply and require no change in spring or car design.

Mills Patch.

The Supreme Self-Vulcanizing Patch for auto tires, motorcycle tires, rubber

The Mills Patch.

boots, hot water bottles, or anything rubber will patch. Mills Patch meets the requirements of all climatic conditions. Its sticking qualities are not affected by heat or cold. Mills Patch Self-Vulcanizing outfit consists of a sheet of pure Para rubber, a tube of their own rubber cement and a buffer. If your dealer cannot supply you they will send same postpaid on receipt of price. Address: Auto Parts Co., 4102 Olive Street, St. Louis, Mo.

The Otter Individual Container Line.

The Otter Mfg. Co., 243 West 17th Street, New York City, have just issued their catalog for 1919, covering full lines of ignition parts and starter and generator brushes for popular systems.

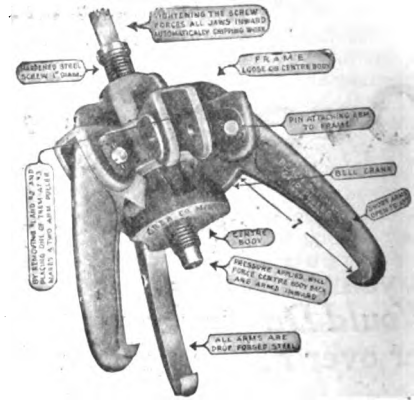
This catalog forms a complete handbook and directory to ignition and starter and generator work, since it carries lists of all cars built during recent years, with a statement of the ignition system in use and the starting and generating systems applied to such cars.

The Otter line of ignition parts is unique in that each part is packed in a rust-proof envelope, carrying on the outside a description of the part with a list of the popular cars upon which the system is used.

Each starter and generator brush or set of brushes is packed in an individual carton, carrying a full description of the brush and its location in the system, together with a statement of the popular cars upon which that system is in use. This feature of the individual packing is of great aid to the dealer, to the repair man and to the user, and while it means much to the handler of the parts, no extra charge is made for this method of packing.

Another feature of this line which attracts attention and tends to systematize the business is the arranging of compact assortments of ignition parts and of brushes, thus giving at a low price complete assortment for general use or for individual cars. The completeness and compactness of this method of handling the goods makes an appeal to every supply house and car agent.

The spring assortments containing full lines of compression and extension springs are popular with the trade, giving unusual value for the money.



The line of electrical cables is complete, being especially selected with a view to automobile work.

In the foregoing it will be seen that the line covers practically the entire electrical equipment of the automobile, outside of generators, distributors, batteries and lights.

Beach Automatic Grip Puller.

A good wheel or gear puller is as indispensable in the garage as a hammer. It may be used in a great many ways. It is practically the only tool with which a flywheel may be removed without the attendant danger of breaking the crankshaft.

The Beach Automatic Grip Puller, here illustrated, is built mechanically right, and when once the jaws are closed on the work and the screw is set against the shaft, it is impossible for them to unhook. Tightening the screw forces the jaws inward, automatically gripping the work, throwing pressure toward shaft or axle, making it more positive and requiring less pressure than the ordinary puller.

The Beach Automatic Grip Puller.

Positively removes wheels, gears, flanges, couplings, universal joints, wrist pins, and any number of other things. Quick, strong, durable, efficient and simple. It is complete with two sets of jaws; three 7½ inch jaws (open to 10 inches), and three 12 inch jaws (open to 18 inches).

Either a two or three jaw combination may be used as there is an extra jaw socket directly opposite one of the other jaws. It is also made with a locking device by which the jaws may be set and locked in any position, which makes it a one-man puller.

This device is manufactured and sold by The Greb Co., of 219 State Street, Boston, Mass., who make a special discount to jobbers, dealers and garages.

Knowlson's Spring Leaf Spreader.

Not long ago we published in our magazine an article relative to the lubrication of automobile springs. The writer of this article claimed that by lubrication the riding qualities could be increased 200 to 300 per cent. As a matter of fact, some man-

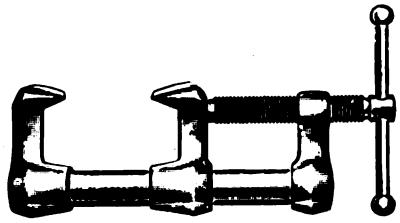
THE hardest job of "clean-up" is made easy by the use of Goblin Soap.

Here's a soap that is mild and effective, it acts quickly and thoroughly, removing the dirt with its soft, creamy lather, which rinses off easily leaving the skin soft and healthy.

Goblin Soap contains vegetable oils which make it wholesome to the skin—it lathers freely in even the coldest water.

Use it in your home for toilet or bath—for kitchen or garage. Fine for the office or the workshop.

If your dealer does not have Goblin Soap, please send us his name and we will see that you are promptly supplied.



CUDAHY, 111 West Monroe Street, Chicago
64 Macauley Avenue, Toronto, Canada

Digitized by Google

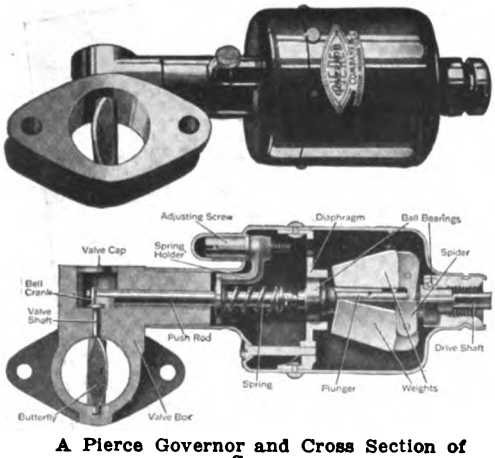
ufacturers guarantee springs for the life of the car if they are kept lubricated properly.

Springs are made of tempered steel, and the leaves cannot be spread apart safely by the old hammer and cold chisel method. They should be pried apart slowly by a special tool called a Spring Leaf Spreader.

Knowlson's Spring Leaf Spreaders

Such a device is manufactured by the Spring Leaf Lubricator Co., Ann Arbor, Mich.

This device consists of a stationary wedged shaped jaw mounted on a heavy casting. Sliding upon this same casting is a second wedged shaped jaw operated through a large set screw.



In operation the two wedged shaped jaws are placed against the edge of the spring leaves and the set screw turned. This forces apart the leaves and permits the insertion of grease or oil.

The same manufacturers market another style of spring leaf spreader which consists simply of a large drop forged casting and a set screw upon the end of which is mounted the second wedge of a pair, the other wedge being mounted upon the body of the tool. This device operates practically the same as the one described above.

The Pierce Governor.

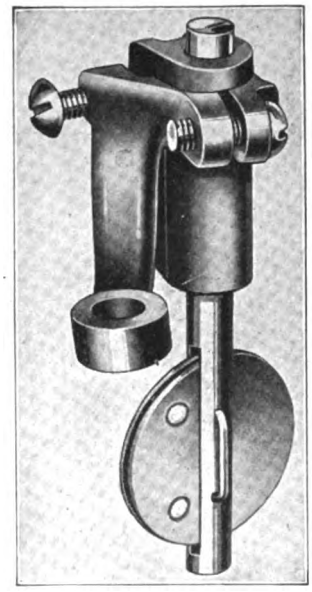
No matter how well you can trust your chauffeur or your truck driver, you can never be sure that he will not forget himself and race your car or your truck at a higher speed than he should.

In the case of your family chauffeur, there is danger in excessive speeding and you may lose one or all of your family. In the case of your truck, the driver is increasing the upkeep and repairs by many per cent., when he runs the truck at a speed greater than it was intended. It is within your power to prevent such over-

A Pierce Governor and Cross Section of Same.

speeding and you can do so by insisting that the manufacturers of your car or truck install a Pierce Governor, sold by the Pierce Governor Co., of Anderson, Ind.

This device operates upon the centrifugal principle, and controls a butterfly valve located in the intake valve between the carburetor and the engine. It cannot be tampered with without the knowledge of the owner. The owner, however, can set it so that it will prevent the car from going above a certain speed.



Since the device is governed entirely by the speed of the car, it does not detract from the engine's power at low speeds, while the car is climbing hills, or running through sand and mud. When you purchase your next car or truck, insist that it be equipped with such a governor.

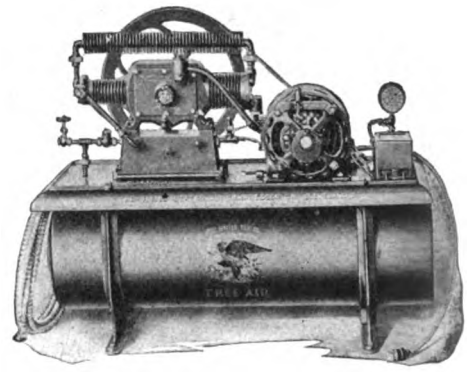
Apex Carburetor Throttle.

The Apex Carburetor Throttle, a novel device, is being put on the market by the Apex Electric Mfg. Co., 1410-12 West 59th Street, Chicago, Ill. This device bids fair to meet with the approval of many automobilists, for it embodies a new principle in carburetion.

The manufacturers have designed this throttle to replace the ordinary butterfly throttle in the Holly or Kingston carburetors used on Ford cars. The device consists of a hollow throttle control lever and a split butterfly valve as shown in the accompanying illustration. When the throttle is nearly closed for starting, no air is admitted through this device.

After the engine is started, however, and the throttle partially open, air is automatically permitted to enter at the top of the carburetor control shaft. This air travels down through the shaft to the split valve and is carried with the mixture into the engine. One can see that a rich mixture can be had for starting, while for high speeds the mixture is automatically made leaner.

The Apex Carburetor Throttle.



The manufacturers claim that the gasoline is vaporized much better, that the engine will not backfire or load up, and that higher gasoline mileage can be obtained.

The Design and Completion of United States Two Stage Air Compressor.

The United States Air Compressor Co. of Cleveland, Ohio, manufacture a complete line of Air Compressors in both the Two Stage and Single Stage types, comprising twenty different units. These units vary in capacity from 1½ cubic feet to 21 cubic feet per minute, and are capable of maintaining pressure up to 500 pounds.

The manufacturers claim the Two Stage principle produces compressors with far greater efficiency than any other design.

Although the Two Stage Power Driven Air Compressor existed long before the

United States Two Stage Air Compressor.

Single Cylinder (Single Stage) Hand Pump, the experience of millions of automobile drivers is cited as evidence that the Two Stage principle is superior to that of the Single Stage.

It is well known that whereas Single Cylinder Hand Pumps were in general use a few years ago, it is a very rare sight to see one now. This remarkable evolution is claimed to have been brought about by the superior construction of the Two Cylinder (Two Stage) Hand Pump. It has been pointed out by the manufacturers that in the design of their Air Compressors, one weakness of the Two Stage Hand Pump has been completely eliminated; furthermore, their machine is improved in fourteen important points.

The operation of their United Two Stage Air Compressor is explained in their literature as follows:

"One of the principal efforts of machinery designers is in the direction of eliminating resistance. The greater the resistance in any machine the lower the efficiency.

"An Air Compressor continually operates against resistance and the unprecedented success of the United States *Two Stage* Compressor has been due to the fact that resistance has been reduced to the very minimum with a relative increase in general efficiency.

"An air compressor must overcome the tank resistance at each impulse or its efforts are of no avail. A single cylinder (single stage) compressor takes air in at atmospheric pressure and forces it direct into the tank. The greater the diameter of the piston the greater the resistance to be overcome and the greater the possibility for piston leakage.

"Now contrast this with the operation of the United States *Two Stage* Compressor: As the piston in *low pressure cylinder* moves to the left it takes air in at atmospheric pressure. On its return this air is forced through Inter Cooler into *high pressure cylinder*, being raised to 40 pounds pressure, the *first stage*. This piston now 'steps up' the air again to a very high pressure twice; a small diameter piston instead of a large one works against the tank pressure; two power impulses instead of one are attained at each revolution; the crank is balanced between two bodies of air which gives a cushioning effect, reducing the noise and vibration to a minimum."

National Thrift—and the Tire Shortage

LAST YEAR—1918—was the greatest in the history of tire accessories. War necessities enforced economy—taught motorists to save tires.

TRADE MARK

This year—1919—will bring even greater sales. Increased car production and depleted tire stocks will prolong the present tire shortage. These conditions—and the national thrift habit of using accessories—treating tires better—require a good stock of accessories NOW.

Goodrich "Standardized" Accessories offer Better Quality with Better Finish at a Better Price to You. Every unnecessary expense eliminated—even packing charges and shelf space saved by our new cartons.

Stock NOW—for 1919

of United States Air Compressors will be sent to anyone who writes the United States Air Compressor Co., Carnegie Avenue, Cleveland, Ohio.

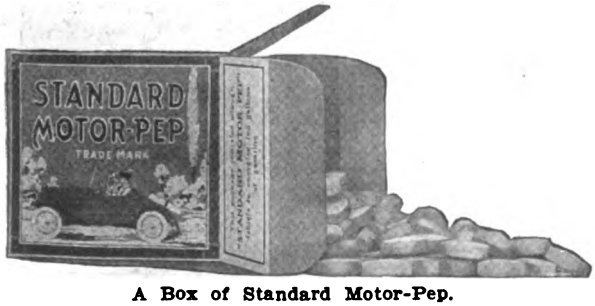
New York Replacement Coils.

Our subscribers frequently write us relative to battery systems, coils and parts. They are not always able to purchase coils direct from the manufacturer. Such subscribers should write to the New York Coil Co., 338 Pearl Street, New York City,

A New York Replacement Coil.

and obtain their catalogue of replacement coils and resistance units for Remy and Delco coils.

This company manufactures a very complete line of high tension coils which can be used in place of practically any coils used in standard equipment.



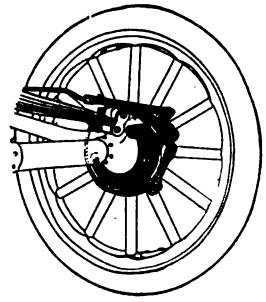
Standard Motor Pep.

Automobile owners in all parts of the country complain of the gasoline which they are obtaining at the present time. The more volatile elements of this fuel seem to be lacking, while the lower test products comprise a large proportion of the fuel.

The objections to this gasoline are first, that a large portion of it will not vaporize rapidly, consequently an engine is difficult to start; second, the liquid carbonizes in the cylinders; and third, the fuel finds its way into the crankcase, and dilutes the lubricant.

All three troubles are caused directly by the fact that the fuel does not burn rapidly enough for the engine. Manufacturers have devoted considerable study to the problem and the Utilities Co., 310 Citizens Building, Cleveland, Ohio, have offered a solution in the shape of a fuel energizer called Standard Motor Pep. This product is guaranteed by the manufacturers to give 20 per cent. more power; to eliminate carbon, and to increase the mileage obtainable by one-eighth.

The fuel is in the shape of tablets and the manufacturers back the product by strong guarantees. They claim to return the money if the tablets do not give the results they claim. A small trial package may be obtained at a very low cost. We should advise our readers to make a trial of it.



A Box of Standard Motor-Pep.

Pla-Safe Emergency Brakes.

Every Ford owner realizes that the Ford emergency brake is incomplete and it does not answer the purpose after the shoes become slightly worn. There is constant expanding action while the emergency brake is being applied which has a tendency to bulge the brake drum to a slight extent.

Add to this the normal wear of the drum and the shoe, and the life of the brake is but short. An external contracting brake, to a certain extent, prevents the bulging of the brake drum and gives an additional braking surface. When the external and internal brakes are locked, the brake drum is held stationary.

Such an external contracting brake is being marketed by the Pla-Safe Co., of Brookville, Pa. This brake is constructed along modern mechanical lines. It can be applied to any Ford car with very little work. There are no holes to drill in the housings, since the castings are held in place by the regular Ford bolts. The Pla-

A Pla-Safe Emergency Brake Applied.

Safe Emergency Brake, as it is termed, is lined with the best lining on the market, and when once applied, brings the Ford braking system up-to-date.

Ideal Hose Clamps.

Every car owner knows how much trouble may be caused by neglect of the automobile cooling system. He knows what an unsightly appearance a water leak gives the radiator or the mudguards, and so he should endeavor to keep the cooling system water tight.

He cannot do this unless the hose fittings are tightly clamped to the castings. A hose clamp which is easily applied and makes an absolutely tight joint is called the Ideal Hose Clamp, and has one outstanding feature which deserves mention. It is so designed that it exerts an even pressure the full circumference of the water hose.

It does not have a dead spot at the bolt side. This feature not only prevents leakage, but prevents the pinching and buckling of the hose. Our readers desiring to obtain this clamp should write to the Ideal Clamp Mfg. Co. 200-202 Bradford Street, Brooklyn, N. Y.

An Ideal Hose Clamp.

U-Fit-It Storm Door Frame.

The Midway Mechanical Co., 1555 Selby Avenue, St. Paul, Minn., are marketing a device which is applicable to Ford cars driven during the winter time. This device is called the U-Fit-It Storm Door

U-Fit-It Storm Door Frame in Use.

Frame, and is capable of making the front curtain open like a door, so giving the occupants a chance to get out of the car without rumpling the curtain.

It consists primarily of a frame designed to fit the front compartment between the windshield and the center curtain of the car. This frame can be fitted very readily to the regular Ford curtain and held in place by rivets and bolts.

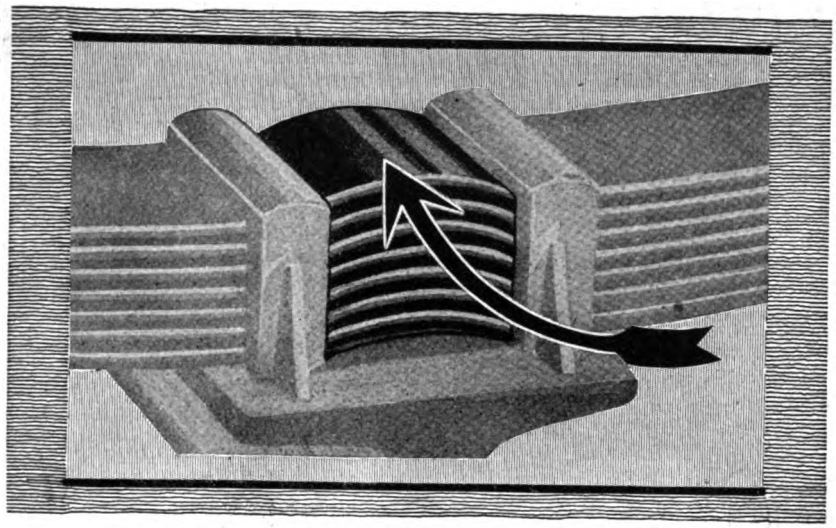
The illustration gives one an idea as to how a Ford curtain can be swung when the device is in use. This saves the chances of celluloid window breakage and rumpled curtains. It can be applied to either side of the car.

Endura Sheet Packing.

Though few motorists realize the fact, 50 per cent. of motor troubles are due to gas or liquid leakage. Let us explain. From the front of the engine to the rear of the differential, every mechanical joint in the housing must be tight or money is lost.

In the engine an open joint may mean oil leakage or gasoline leakage. If the joint is open in the base, the oil will be lost, and there is chance for extensive damage. If the manifold joints are not tight, the engine will not develop its maximum power. Cylinder oil or transmission grease cost too much money to be thrown away upon the road.

The autoist should insist that his garageman in making repairs pay particular attention to the packing used.



A packing which should be of interest to our readers is sold by the Endura Mfg. Co., 63d Street and Eastwick Avenue, Philadelphia, Pa., and 45 Lafayette Street, New York City, N. Y. This packing can be used very extensively in the car. It is sold in sheets and said to be oil-proof, gasoline-proof, and to withstand both hot and cold water.

Giving service

—and making it mean something

TUTHILL Titanic Springs give and offer the kind of service that helps build business.

First, they are built strongest to wear longest where three out of four springs give way first.

A solid bed of jolt-and-jar-taking steel meets every strain with swift response and sure strength. No center bolt holes—or nibs—weaken the vital point. The center never snaps, causing sudden breakdown.

Tuthill Titanics are so perfectly constructed that they are guaranteed at all points and in every respect for one year—and guaranteed *forever* against center breakage—where three ut of four ordinary springs break. Thousands, through years of steady use, prove that the guarantee holds good.

Quick service when needed, is badly needed—and there's a Tuthill Distributor near at hand wherever the motorist happens to be. Tuthill Distributors carry representative stocks and can always provide the right spring for any passenger car or truck.

Utmost convenience and minimum loss of time in spring replacement awaits the motorist when he looks for Tuthill Titanics. Absolute confidence and steadily increasing sales are assured the dealer handling Tuthill Titanics.

See "Chilton's" or "Auto Trade Directory" for complete list of Distributors.

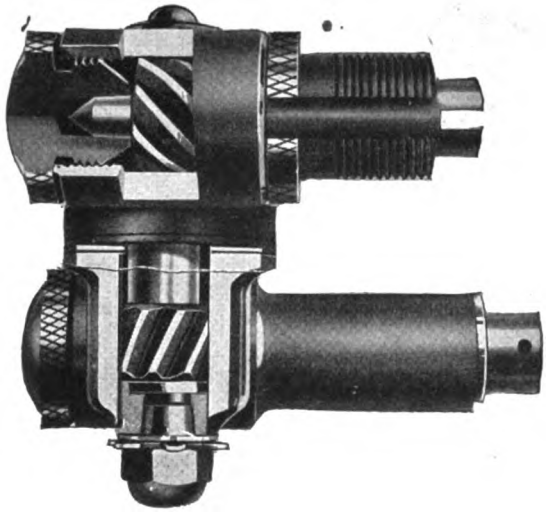
"Why Is Carbon?"



A little booklet entitled "Why is Carbon?" has been published by "C-P" Chemical Co., 305-326 River Street, Chicago, Ill., the home of Carbon-X. This booklet seems to be of unusual interest to the car owner, as it discusses the so-called carbon problem in an honest and straightforward manner, and the motorist will no doubt find much valuable information contained therein. It is our understanding that the publishers will send a copy of "Why is Carbon?" free to anyone on request.

F. W. S. Swivel Joint.

F. W. Stewart, manufacturer of a number of live items in the accessory line, believes that if you have a good thing you ought to show it.

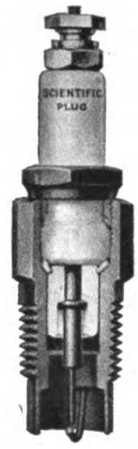
He is a firm believer in the F. W. S. Swivel Joint for speedometer drives and is putting out a novel idea for the jobbers' salesmen to demonstrate the quality of that Swivel Joint, by showing the "inside of the works."

The Swivel Joint furnished has sections cut out as shown in the illustration, displaying the various points of superiority so that they may be readily understood by those not entirely familiar with the structural details of such devices.

Section of the F. W. S. Swivel Joint.

They are sent out to jobbers for the use of their salesmen when calling on their trade.

Owing to the considerable expense in producing these cutout Swivel Joints, they are not being sent broadcast but any recognized jobber may secure a number sufficient for their salesmen by writing to F. W. Stewart, 1404 S. Michigan Avenue, Chicago, Ill.



Returns From Service.

Mr. C. B. Johnson, formerly the sales manager of the Advance Automobile Accessories Corp., has been released from his military duties and has taken the position of sales manager of Auto Components, Inc., Chicago, Ill. This concern has been organized to market the Red Star Timer for Ford cars.

Scientific Spark Plug.

We reproduce herewith a cross sectional view of a new spark plug which is being manufactured by Geo. T. Simmons of Janesville, Wis. If the reader will examine the illustration carefully he will notice that there is a unique feature about this plug. Its skirt is especially thin.

When in operation the heat generated by the explosion tends to heat this thin skirt, resulting in the burning of oil or carbon deposits from the electrodes. From experience the reader knows that in any plug the center electrode is seldom covered with soot or oil. The deposits usually are found inside the body of the device.

The Scientific Spark Plug

So with the construction of the Simmons plug; the manufacturer claims that the design embodies a new principle. The plug is very accessible and easily cleaned. The insulating material is of extremely high resistance and is said to withstand the engine heat to a remarkable extent.

Livingston Radiator Corporation.

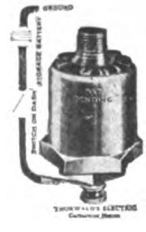
It is announced that the rights to manufacture radiators for automobiles, trucks and aeroplanes under the Livingston patents, formerly owned by the Livingston Radiator and Mfg. Co., at 205 West 75th Street, New York, have been purchased by the Livingston Radiator Corporation of the same address.

A Livingston Radiator.

The new corporation also takes over all the mechanical equipment and processes of manufacture of its predecessor, and will place the production of this type of radiator on a quantity basis.

A new management will have charge of the affairs of the new organization. The inventor, D. McRa Livingston, again becomes associated with the manufacture of radiators under his patents, and will be vice-president and consulting engineer. E. G. Hines is president and general manager.

The Livingston Radiator was specified for installation on over 50 per cent. of all aeroplanes purchased by the aerial forces of the U. S. Army and Navy.



S. O. S. Storage Batteries.

Readers who intend to purchase storage batteries should by all means investigate the batteries sold by the Victor Storage Battery Co., 701 Fourth Avenue, Moline, Ill.

This concern put out the S. O. S. storage batteries and guarantee their product against the ruinous sulphation which attacks ordinary plates. They also claim that S. O. S. plates (which may be had to fit other batteries) will not buckle during the life of the battery. Dealers who have any call for storage batteries should write this concern for their list and pocket battery guide which shows the correct battery to use for any make of car.

"YANKEE" TOOLS

Make Better Mechanics

Here's one of the famous "YANKEE" Tools that does automatically what other tools compel you to do by hand. Steady your work on the table with one hand; turn the crank with the other.

The automatic Friction Feed runs the drill rapidly down to the work and takes the place of the third hand you haven't got.

The instant the drill point touches the work the Ratchet Feed "takes hold." The drill is fed through the cut—steady, positive, smooth. No need to worry about broken drill points; rather, think of the time and labor you could save with other and equally ingenious "YANKEE" Tools.

"YANKEE" Bench Drill

"YANKEE" Bench Drill No. 1005. Two speeds, 3-jaw chuck, holds drills up to ½ in. Height 28 in. Price (Philadelphia) . . **$19.25**

"YANKEE" Bench Drill No 1003. 2-jaw chuck, holds drills up to ¼ in. Height 18¾ in. Price (Philadelphia) **$11.50**

"YANKEE" Vise No. 990. Accurately machined sides, ends and bottoms, for holding work on Bench Drills and other machine tools. Swivel-jaw for taper work; groove for rounds. Base 6 in. long, 2⅝ in. wide. Price **$2.50**

Your Dealer Can Supply You

A New Sales Promotion Manager.

As a result of a new and more aggressive policy of the Connecticut Telephone & Electric Co., of Meriden, Conn., Mr. O. H. Adams has been given the position of Sales Promotion Manager. This company is a large and growing concern, being one of the biggest producers of interior telephone systems, and having developed and manufactured during the war a goodly percentage of the field wireless equipment for the U. S. War Department. Mr. Adams began his duties in his new capacity on December 30th, 1918, and all indications point to a bright future.

St. Louis Motor Generators.

The attention of our readers is called to the big field and big money offered in storage battery recharging. The work is easily learned and the profits large. In practically any garage where outside current is available, storage batteries may be charged. In most cases the outside current is had at high voltages, 110 or 250, either direct or alternating.

Where such high voltage is had, current cannot be used economically because much is wasted in resistance. The alternating current must be changed by some means into direct current before it can be used. There is one way of accomplishing either or both of these purposes; that is to drive a motor from the outside line and use the power from this motor through a generator to produce low voltage current, for battery charging.

The St. Louis Electrical Works, 4057 Forest Park Boulevard, St. Louis, Mo., manufacture a combination unit consisting of a motor driven from the outside current, and a generator which produces direct current for charging the batteries.

These machines may be obtained in two sizes. The smaller has an output sufficient to charge as many as eight six-volt batteries at one time, while the larger size gives sufficient current to charge as many as twenty-four.

The motor and generator are both mounted upon a substantial base. No gearing is necessary between the two since both operate upon the same shaft. With the equipment is furnished a suitable switchboard equipped with a rheostat, ammeter and switches for controlling the current, so that any number of batteries may be charged from one to the capacity of the machine.

Magic Rubber Mend.

The Eastern Rubber Co., of 1529 Ridge Avenue, Philadelphia, Pa., are putting on the market a product which deserves mention. This product is known as Magic Rubber Mend, and can be used for patching not only tires and tubes, but hot water bottles, rubber boots, and in fact anything made of soft rubber.

The product is readily applied without the use of heat or acid. There is no danger of under-vulcanizing or over-curing, and the manufacturers claim that a patch made with it will outwear the tube or tire upon which it is placed.

Duplicate Parts.

The Nilson-Miller Co., 1302 Hudson St., Hoboken, N. J., announce that they are able to duplicate any machine part of any automobile now on the market, so that anyone who owns an orphan car, or anyone who owns a car, the parts for which are difficult to obtain, may write to Nilson-Miller at the above address, giving them the specifications, and obtain such a part.

This company makes a specialty of grinding cylinders and fitting both pistons and rings. They also carry a large line of gears and sprockets.

Pirate Parts Suit Settled Out of Court.

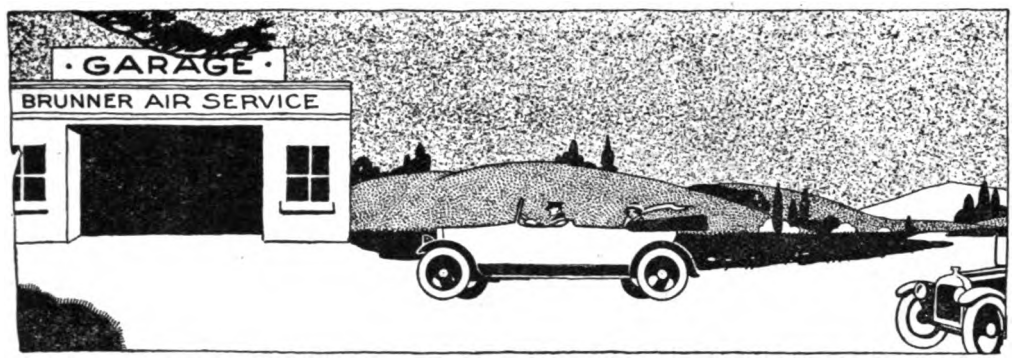
Despite the fact that there has been considerable talk of concerted action on the part of ignition makers to preclude the manufacture of replacement parts for their systems by others than themselves, nothing came of it until the Connecticut Tele. & Ele. Co., of Meriden, Conn., took the bit in its teeth and brought suit in equity in the District Court of the United States, Northern District of Illinois, Eastern Division, against Paul G. Niehoff & Co., Inc., of Chicago. The bill charged infringement of the following patents:

No. 1,204,104, dated November 7, 1916
No. 1,217,566, dated February 27, 1917
No. 1,221,239, dated April 3, 1917
No. 1,248,612, dated December 4, 1917

The bill also charged practices of unfair competition in the sale of parts shaped and dressed in simulation of the plaintiff's corresponding parts, and prayed for an injunction and accounting on both phases of the bill.

This case is of particular interest to the public on account of the fact that one of the largest manufacturers of ignition systems instigated this suit against a large manufacturer of what is commonly known as pirate parts.

The Niehoff Co. succeeded in settling this suit before coming to trial, by recognizing the validity of these patents after careful investigation and agreeing to discontinue the production and sale of all infringing parts they had been making to fit Connecticut systems, and to substitute for them genuine parts made by the Connecticut Co.



The correspondence which passed between Mr. Niehoff and the Connecticut Co. between the time the suit was instituted and the settlement, brought out the fact that the Paul G. Niehoff & Co., Inc., never relished its position as a pirate parts maker; but that the independent attitude of the ignition manufacturers not only made it almost impossible to do business in genuine parts and practically created the file for "pirate parts."

Clearly a little more of the live and let live spirit is the solution of the whole situation.

For the out and out manufacturer or distributor of "pirate" parts, there should be no place in our commercial scheme, as there is every promise for urging ignition makers to fight the pirate parts evil by enlisting such distributors as prefer a legitimate business in their side, instead of standing pat on a policy which arrays them against them.

Mr. Niehoff expressed the hope that the arrangement which now exists between his concern and the Conn. Company would prove the beginning of better conditions all around and that his action would have its effect on those engaged in the pirate parts business, also that the live and let live spirit of the Connecticut Company would have its influence on the future policy of other ignition manufacturers, which would bring about results of mutual benefit, but until such arrangements are entered into, they will continue to establish their Service Stations as heretofore, and place their famous "Cash Registers of Contact Parts," stocked with other than genuine parts for all systems, excepting Connecticut.

BRUNNER AIR SERVICE
AIR
THE MOTORIST WHO IS BRUNNERWISE KNOWS BRUNNER SERVICE SATISFIES

This red and blue enameled sign is distinctive—not easily confused with others. The motorist looks for it. It brings him to you for service and sales. Furnished FREE to users of Brunner Air Compressors.

THE BRUNNER AIR SIGN MEANS GARAGE SUCCESS

The ability to render, permanently, satisfactory service spells success in every line of business. The Garageman is no exception to the rule. Be his organization ever so perfect and his equipment the best,--if there is but one point in which service is lacking or not always available or satisfactory, that is enough to keep hundreds of dollars away from him.

A dependable air compressor is a vital part of the garage service. The motorist expects to find air service in every garage and he will go to the one that renders the most dependable service.

No. 542 Outfit

Ideal for installation where space is limited. Has ample capacity for garage housing up to forty to sixty cars. The motor is ½ H. P., securely bolted to substantial cast-iron base and mounted on a 32 gal. Welded Open Hearth Flange Steel Air Tank, tested to 300 pounds

The Compressor is our No. 102, 2-cylinder air cooled, each cylinder fitted with a safety valve than can be instantly set for any desired pressure and absolutely dependable under all conditions.

The outfit includes air gauge, check valve, 25 feet of 3/16 in. "Resistoil" air hose, connected to one No. 82 needle valve on one end and having automatic tire connections on the other.

When used with our Model M Controller, this outfit is entirely automatic.

BRUNNER Air Compressors

The Brunner Air Compressor was designed especially for garage use It is built in the largest, best equipped plant in the world devoted to the exclusive manufacture of garage air compressors. The employees of this plant take great pride in the product, and every part of the work and every piece of material is the very best. Bearings are as carefully made and fitted, cylinders as carefully ground, piston rings fit as perfectly, as in a high-priced automobile engine.

On a Brunner Compressor there is no need for attachments to help the motor carry the load—no restriction of lubrication to pull down the efficiency, increase wear and run up bigger-than-necessary electric bills. Maximum efficiency is attained with a minimum of operating and up-keep cost. Brunner Compressors are built to operate under the hardest working conditions, day out and day in, with but little attention and yet perform consistently and satisfactorily.

Send for Catalogue No. 15, showing the most complete line of small air compressors on the market, and the name of the Jobber covering your town.

If you want assistance in planning or improving your air device, our factory engineers are at your command. Tell us how we can serve you best.

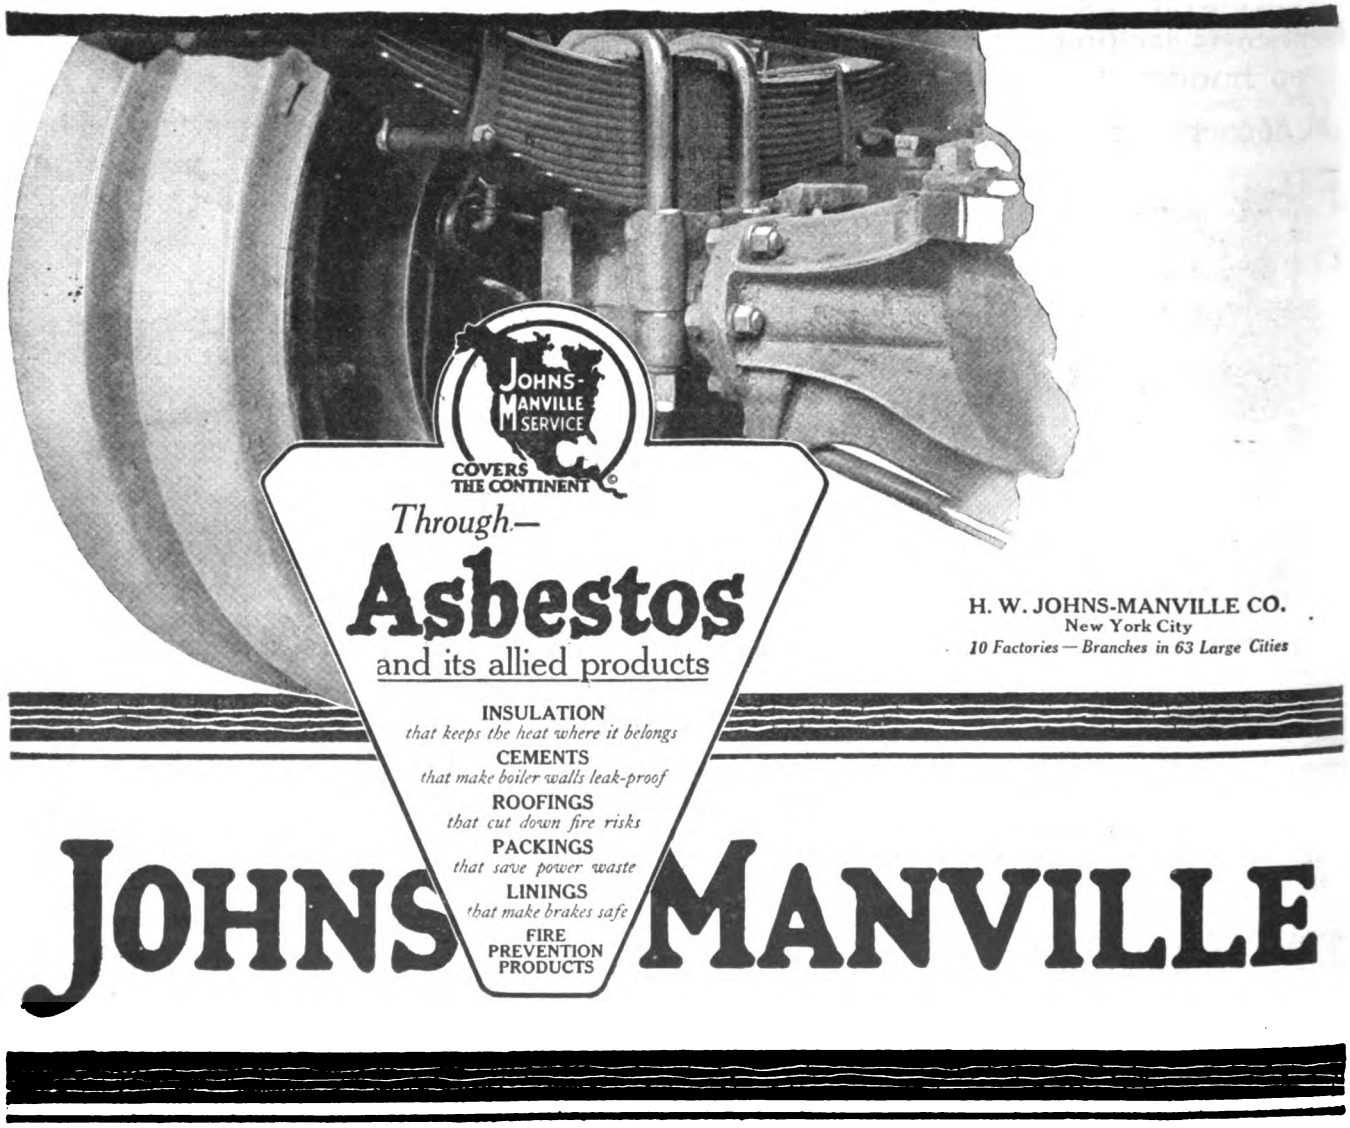
On the Business end of a Truck.



Any brake lining soon proves the truth of the statement, "The better the Asbestos, the better the Brake Lining." No service demands more of brakes, and no lining ever meets a harder task than when it is on the business end of a truck.

That's why you can sell a brake lining on the quality of its Asbestos Fabric.

JOHNS-MANVILLE
NON-BURN ASBESTOS BRAKE LINING

The fabric of NON-BURN is woven of special, selected fibre from the Johns-Manville mines —culled from tons upon tons of asbestos—and chosen for its Brake Lining fitness.

And the Johns-Manville sales policy protects you in every way, assuring you of a substantial profit on each sale.

Digitized by Google

—and to protect the valuable truck cargoes of today.—

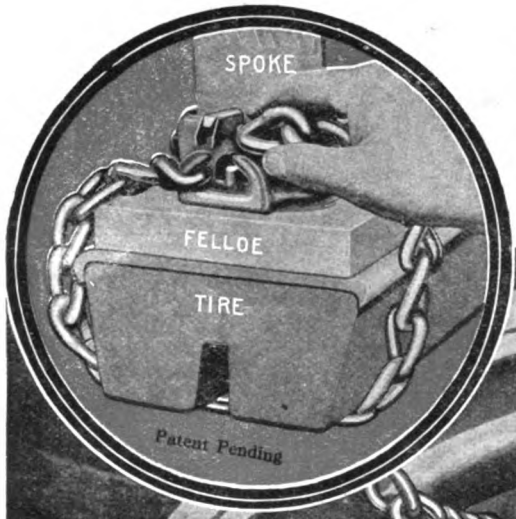
THE values of cargoes moved by motor transport are higher today than ever before. The motor truck is probably insured, but few, if any, cargoes are insured while in transit.

With a Johns-Manville Fire Extinguisher on a truck every load is protected. Spread over a number of cargoes the cost of protecting each cargo by having a Fire Extinguisher handy is only a few cents per load. This is a strong selling argument—use it.

The Johns-Manville is the only one-quart extinguisher that can be discharged in either of two ways. If the fire is accessible, pump it as with ordinary extinguisher; if hard to get at, or if the operator is in cramped quarters, the stream can be discharged by air pressure, allowing the extinguisher to be aimed like a fireman's hose. Prove this to your customer—put his thumb on the lever.

JOHNS-MANVILLE FIRE EXTINGUISHER

Can be operated by anybody, in any position, anywhere



Price $10 $10.50 West of the Rockies
In Canada $12. West of Calgary $12.50
Brass or Nickel. Bracket included.

ARROW GRIP

NON-SKID CHAINS FOR SOLID TIRE VEHICLES

Just slip chain around and press down latch —that's all. Latch can't accidentally open. Chain is 100 per cent. overstrength; clamp is rustproof. To detach, slip any handy tool under latch —lift up chain.

Simplicity—Safety—Salability

400,000 trucks in use — and every one means a potential Arrow Grip sale.

Not only on snow-bound streets and roads—but wherever there is mud or wet or possibility of skidding, Arrow Grips are used because they can be attached easily and quickly and with least labor.

Arrow Grips are now big all year-'round sellers.

Note the simplicity of Arrow Grip construction. Note that there are but two parts. Note that there are no specially forged connecting links in the chain. Note that one hand can attach or detach, that no special tools are needed. Note that the pull is on the ***felloe***—not on the spokes or the clamp.

Arrow Grips are the ***matchless*** non-skid device.

Write for our dealer offer before it is too late.

IN the sum total of results achieved by the various engines of war in the Great Conflict, the part played by *motors* will furnish an exciting chapter of its history.

American Hammered Piston Rings had the distinction of being chosen for War motors by the United States and our Allies. The consequent enormously increased production which this necessitated equips us splendidly to handle a much greater volume of after-war business.

Manufacturers, Jobbers and Dealers are urged to communicate with us relative to their 1919 requirements

What our customers say about 'em is the best endorsement for GLOBE AIR COMPRESSORS

INVARIABLY they make good—and give satisfaction. We can cite or submit letters from any number of our customers to show you just what GLOBE air compressors are doing.

Not long ago, one of our customers in Springfield, Ill., (name on request) wrote and told us, voluntarily, that their GLOBE machine was giving perfect satisfaction, and they would recommend it to anybody.

Another one of our customers at Maquoketa, Iowa, (name on request) said their GLOBE worked like a charm, and that they felt safe in predicting that the saving of electricity used with the GLOBE would almost pay for the cost of the pump within a year.

You take no chances with a GLOBE

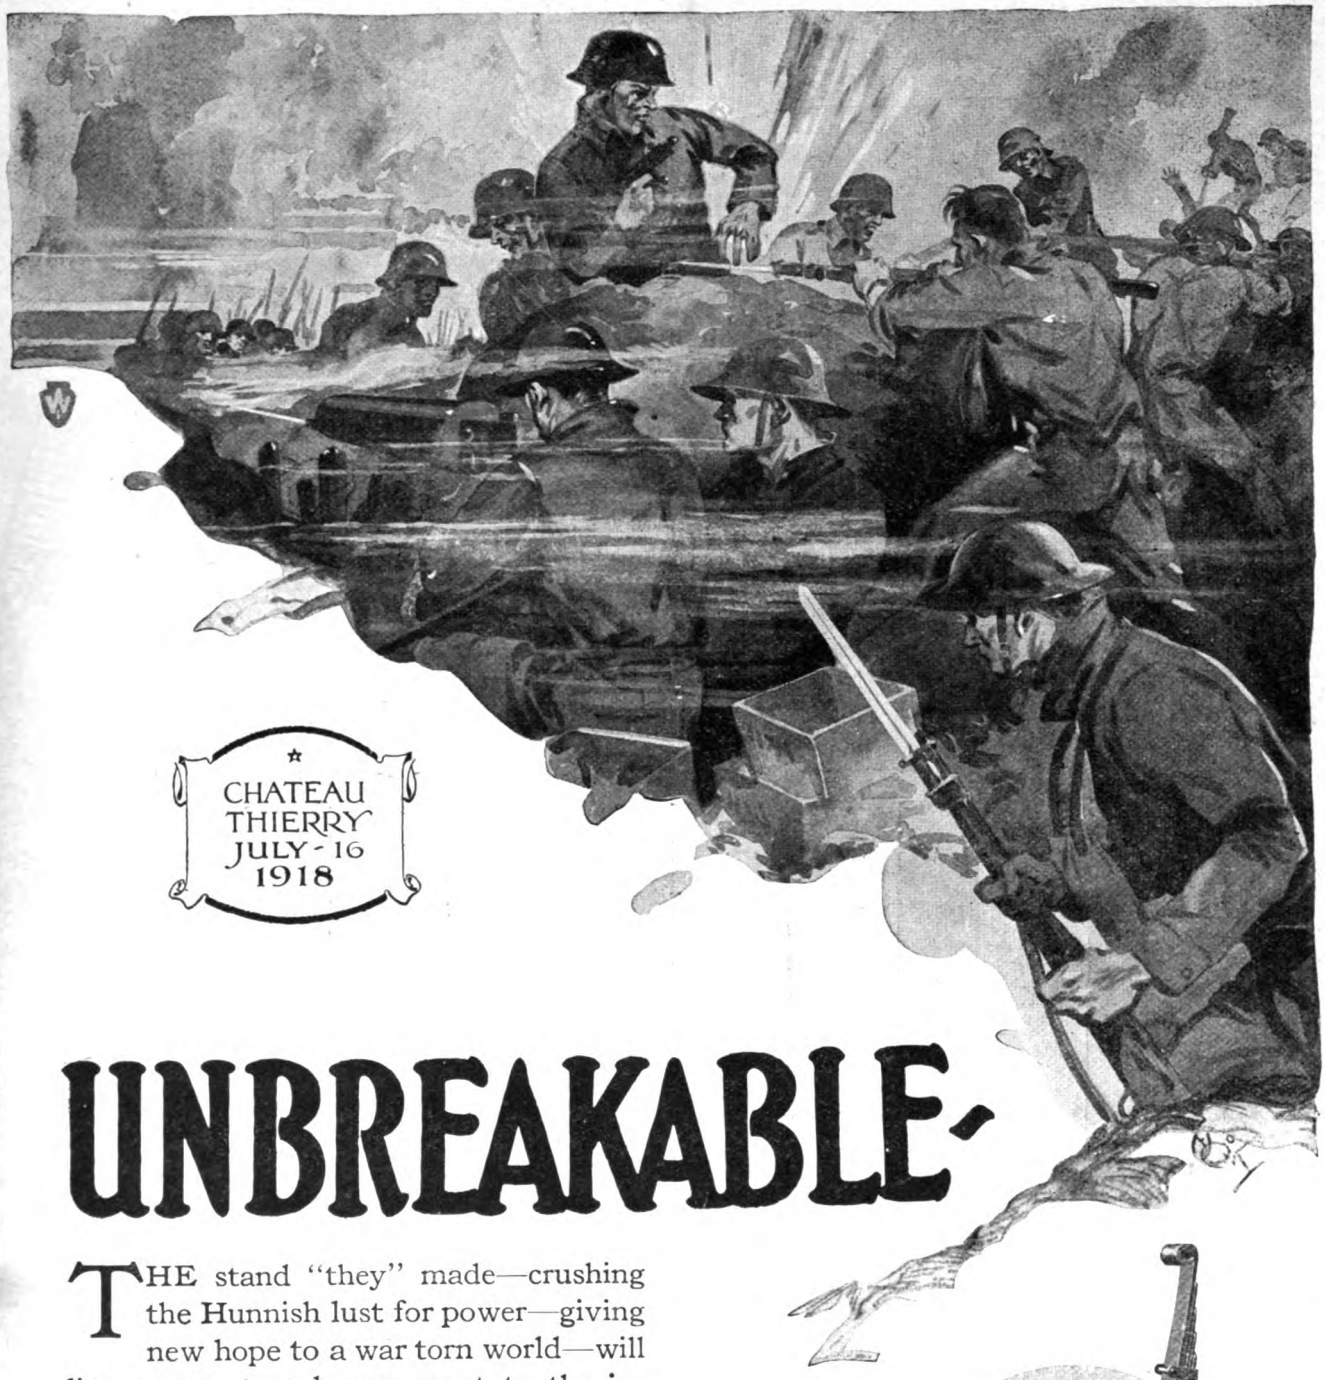
A SURE SIGN of carbon is a smoky exhaust, due to lubrication getting *past* the piston rings up into the combustion chambers where it *burns*. Leaky piston rings waste as high as 25% gasoline —one drop in four.

HI-COMP PISTON RING

"THE RING THAT MAKES THE MOTOR SING"

are the best gas-tight rings for overcoming engine troubles due to carbon—knocking, skipping, faulty ignition; valve pitting, wearing down of cylinder walls, piston and piston rings; smoky exhausts.



Hi-Comp Piston Rings are made from two perfectly balanced perfect eccentric rings into one absolutely gas-tight concentric ring. Each ring ground under oil — not buffetted — to preserve the true temper of the secret process gray iron and ensure high polish and gas-tight fit. Won't wear cylinders out of round — *proof* of gas-tightness. Make reboring of average cylinders unnecessary — an exclusive Hi-Comp advantage. Hi-Comp Piston Rings deliver every ounce of power from every drop of gasoline on to the piston head— no power or oil can get past them!

It will pay you to install Hi-Comp because of the satisfaction they give to you and your customers. Fully guaranteed by an old established piston ring company to give MORE POWER on less gasoline and oil. Write for booklet, specification chart and details of 90-day trial guarantee

Honorably Discharged with An Admirable Record

Usaco AIR COMPRESSORS TRADE MARK

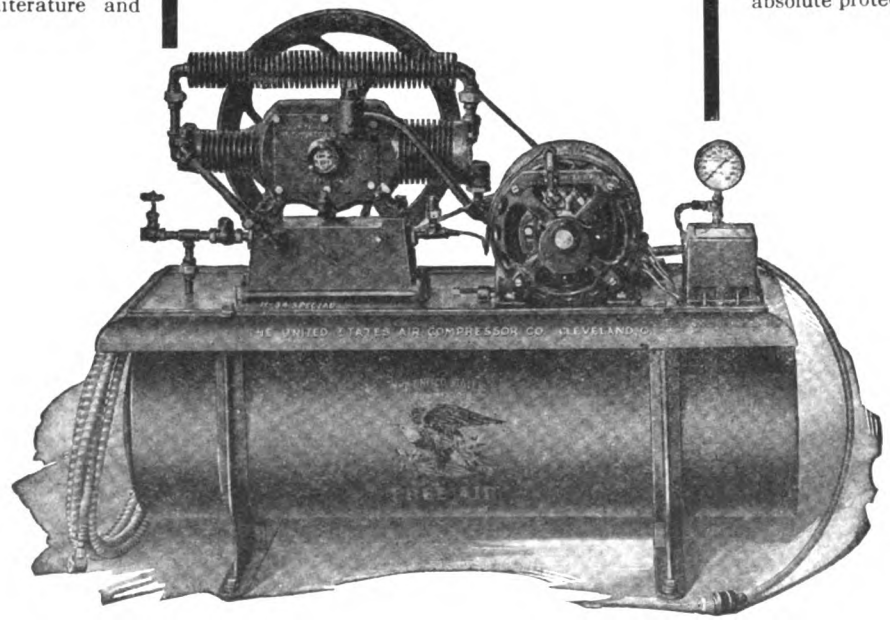
The USACO Two Stage De Luxe Automatic Air Unit.

Through inherent high quality alone this Compressor has commanded respect for years and found its way into a majority of the better garages, tire shops and filling stations. It is exceptionally quiet in operation, capable of delivering the highest pressure ever required and so constructed as to render service indefinitely.

Each season the De Luxe has grown in popularity but the changing conditions now apparent make the use of this unit not only more desirable but almost imperative. Tires are now in use of such size and pressure as were not even thought of two or three years ago. To meet these unusual conditions requires an **UNUSUAL** compressor. The De Luxe is the one ideal unit available. Send for literature and judge for yourself.

HAVING fulfilled our obligations to the Government in supplying hundreds of **USACO** Two Stage Automatic Air Compressors for war service here and abroad, our entire organization is again on a Peace basis, ready to afford the best of attention to regular requirements.

Being designed originally for the most severe service known, it was natural that **USACO** Two Stage Compressors should have passed the exacting tests and measured up to the high ideals of the War Department without change in design.



In war, seconds count—there is no time to await the slow, painful efforts of inefficient compressors. Under such conditions the tendency is to "under-inflate," with its high toll of tire destruction. By furnishing instant, high pressure service, **USACO** Two Stage Compressors avoided these serious features and undoubtedly saved thousands of dollars.

The USACO Line of Air Compressors.

The **USACO** Line of Air Compressors comprises different numbers in Two Stage and Single Stage types and various individual units adapted for forming combination of almost unlimited kinds and capacities.

Each machine is designed to fill a particular need and it will perform that service in a manner that is never excelled and seldom equalled.

The **USACO** Guarantee is the strongest ever applied to air compressors—and absolute protection to purchasers.

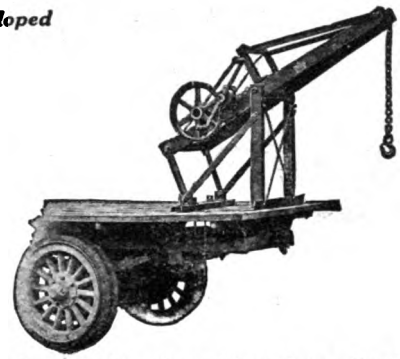
MANLEY GARAGE EQUIPMENT

THE KEYNOTE TO EFFICIENCY AND INCREASED PROFITS

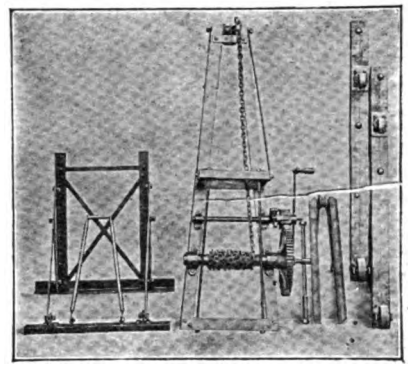
Manley General Utility Garage Crane

The Most Universal Garage Tool Ever Developed



As a Portable Floor Crane for inside or outside uses
Capacity 1½ tons Price, $132.00

A half dozen different tools combined into one.



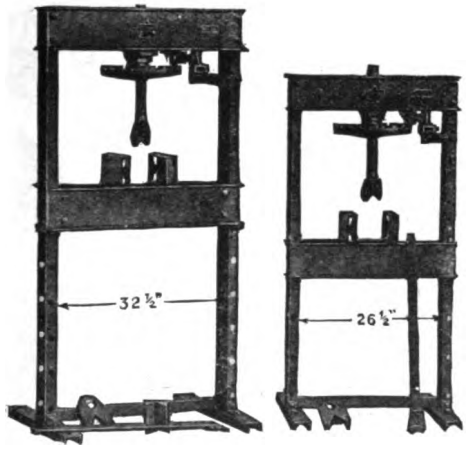
May be used for a hundred different purposes inside the Garage and outside in the country. May be mounted on a truck, chassis of service wagon for use as a general wrecking Crane.

Goes on and off a truck so easily and quickly it is not necessary to keep it tied up for this purpose only. If no truck is available, it may be taken apart and into the country to a wreck on a touring car.

It is taken down and put together again by two men in five minutes. Takes up no room when not in use.

As a Wrecking Crane Mounted on a Truck
Capacity 2 Tons Price, $112.00

May be used inside the Garage for every lifting operation and outside the Garage for wrecking purposes of all kinds. It therefore does double duty.



Any Garage using this Crane will get all the wrecking jobs. It will handle them as no other appliance can, five to ten times quicker. It is specialized for this work.

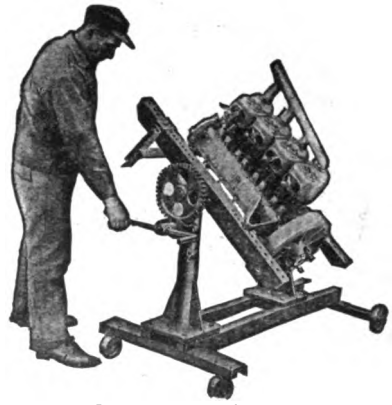
The biggest money making tool for the Garage on the market. Every operation performed by this Crane is one for which the Garage receives big money.

This Crane is constructed throughout of steel except the gearing which is cast iron and the base is seasoned white oak. It has four different leverages to suit all classes of work. The beam may also be tilted to any position from the horizontal to the vertical.

Lift as a floor crane 7 feet, overhang 36 inches, weight 485 lbs. Price, $132.00. Overhang as a wrecking crane 42 inches, weight 375 lbs. Price, $112.00.

MANLEY 22 TON PRESSES

No. 1 Garage Press Price, $98.00 No. 2 Garage Press Price, $82.00



The Manley Line of Garage Presses consists of 4 different sizes making it possible for the Garageman to select a Press to exactly suit his class of work to the best advantage. These Presses have been highly developed and specialized for auto work and possess several exclusive features vitally necessary to handle this work to the best advantage in the shortest time and with the least effort. The two speed, quick change leverage is a tremendous advantage, the screw striking feature for extreme cases, the quick adjusting tables, the possibility to open the side bars to straighten chassis frames, the self-adjusting V Plate, etc., are also instantly appreciated by any Garage operator as real necessities.

MANLEY UNIVERSAL ENGINE STANDS

Plain Geared Stationary Portable

Large and Small

Ford Special Stand

Portable Geared Stand
Motor is Easily Revolved

In Repairing Engines it is only reasonable that every facility should be given to the workman so that he can work to the best advantage by having the motor properly supported so that he can turn it to any position in order to work on the various parts with the greatest ease in a perfectly natural position without cramping, without stooping and without danger. This is what the Manley Engine Stands were designed to do and is what they do with the highest degree of efficiency.

BIGGER PROFITS

THAN YOU EVER GOT IN YOUR LIFE, MR. DEALER

—ON—

KIMBALL TIRES

If there's anything slower than molasses it's high priced tire sales—keeping your capital locked up tight, your business stalled, and the big clean profits others are packing away are nowhere in sight for you, just because you got on the wrong track.

KIMBALL TIRES give you the inside track because they are clean firsts at the prices others get for seconds.

You can't compete with factory branches, distributors and preferred dealers on high priced tires. You can't compete with the mail-order and cut-rate houses on seconds. ***SELL KIMBALL TIRES AND YOU CAN BEAT THEM BOTH!***

This is a big country and there is a chance for you to get in on a piece of choice territory yet if you will write us quickly—but there really must not be any delay. Remember this: all Kimball Dealers are prosperous business men who have built their names and reputations on "Kimball's Firsts" instead of on somebody else's seconds. They will tell you so. Get in touch with us. Send sample order at once. We guarantee our tires to be new firsts and will refund your money if tires are returned in three days in the condition in which they were received. Don't delay.

The Prices Speak for Themselves

TIRES
SELECTED BLEMISHED

MAKE 1919 a banner year in the way of profits—handling tires in selected blemished stock, popularly known as "Seconds." We sell them at 40 to 60% off lists. Your profits are easily 25 to 40% on your investment.

Who can handle these tires? Machinists—Repair Shops—Accessory Stores—Tire Shops—Vulcanizing Shops—Hardware Shops—General Stores,—etc.

Is it a desirable business? Yes! emphatically so! since about 75% of our retail business is repeat business. You will find it the same in your case.

How much do I need to start? Anywhere from $100 and up according to locality. And the money should be turned over five to seven times.

Do I need any special knowledge of tires? No. With each initial order of $100 or more we shall be glad to send gratis a book showing list prices, description, and vital information of all tires manufactured.

Please address us for more detailed information and stock lists, on your letterhead.

"Look for These Tools at the Automobile Shows"

The mechanical superiority of the
F.W.S. Roller Bearing makes them
"First Choice"

All of the good features which a roller bearing should have are incorporated in the design of the F. W. S. Bearing. These are the features which mean better service and longer service in the F. W. S. improved retainer:

PERFECT ALIGNMENT OF ROLLERS—Broad-wings of Cage provide broad and smooth surface against rollers, so rollers cannot get out of line.

EXTRA STRENGTH—Strong Cage is secured by double walls of high carbon steel, outer edge reinforced by turned edge, giving three thicknesses at that point.

EQUAL BEARING SURFACE—Due to the double walls of retainer having equal wings on each side of rollers.

LUBRICATION—The wings provide pockets to retain the grease, but accumulated dirt cannot pack in around the rollers.

CONES AND RINGS made of especially prepared steel properly tempered and ground to absolute accuracy in size and contour.

Satisfaction Guaranteed. Dealers and Garagemen Write for Further Particulars

National Needs

have made curtailment of rubber imports necessary. Already the excess of demand over supply has caused an increase in tire prices—other increases are imminent.

It's Time Now for Economy

If your heart is in this war, you will clearly see the need of getting the last fraction of a mile out of your tires. You can do so by coupling your patriotism up with

National Tire Filler

Motorists Have No Tire Trouble Who Ride on This Perfect Substitute for Air

Rim-cut-proof, blowout-proof, puncture-proof tires are now a reality. Motoring is now freed from the shackles of tire trouble, and is made safe, comfortable and enjoyable.

National Rubber Tire Filler replaces the inner tube. It has all the resiliency of an air-filled tire with none of its disadvantages. It lasts indefinitely—40,000 miles or more. It has been in use for five years and has conclusively proven its superiority and economy over air-filled tires. Our factory taxed to capacity is proof positive of its great popularity.

It rides as easy as air.
It cannot puncture or blowout.
It can be used in all style tires.
It can be installed on all makes of rims.
It doubles tire mileage.
It is easily installed.
It stimulates motoring.

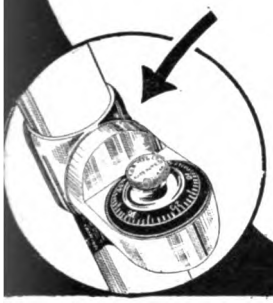
COMBINATION AUTO



LOCK

Can be sold by Automobile Dealers and Garage men because

1st.—When shown the car owner, he appreciates immediately why the lock makes his car thief proof.

2nd.—Every car owner needs a lock, but knows a thief can pick a key lock with a hairpin. He has been waiting for a practical combination lock, and here it is.

3rd.—The F. O. B. Mfg. Co. guarantees the lock to last longer than the car. Besides making the car thief proof, the lock itself is fully guaranteed.

Call at our booth at the New York Show from Feb. 1st to Feb. 8th and convince yourself of the F.O.B. Lock's superiority over any lock you ever saw.

ASK YOUR JOBBER

For Your Battery Shop Supplies

Your jobber is in business for *your* benefit. While he makes a small profit on the goods he sells, he saves you far more in time, worry and money. He hunts out and purchases the very best in every line—and keeps it ready to deliver to you on your orders. You never need to search the country over for supplies or repair parts—if you depend on your jobber.

As all new devices and wares must satisfy his rigid tests before he offers them to you, all your purchases from him bear his endorsement as well as that of the maker.

AMBU CADMIUM TEST OUTFIT. To test both sets of plates in the storage battery without taking it down. This is proving one of the greatest labor savers — time savers — and battery savers ever offered to the repair man. Consists of specially calibrated and voltmeter with the indicated correct readings shown on the dial in red. A pair of rubber tipped cadmium leads to reach the different plates. Packed in convenient cases with complete instructions. Outfit complete $25.00. Voltmeter only, $22.50. Cadmium only, $3.00.

AMBU BATTERY STEAMER. Softens compound in battery in 15 min. without danger of injury to jar or connections. Needs no attention—Works while you are busy. Price complete $25.00.

AMBU BATTERY PLATE PRESS. To press and strain plates. One of the most valuable "salvage" devices in any shop. $32.50.

AMBU PLATE BURNING RACK. To hold battery plates in position while burning in new ones. Great time saver. $7.50.

AMBU LEAD MOLDS. For molding into convenient usable form lead scrap and trimmings. Most shops need several. Each $1.75, $3.25.

AMBU WIRING DIAGRAMS. All the 1917 and 1918 cars' electrical systems diagrammed. Book of over 300 for $3.50. Single sheet diagrams of older models, 25 cents each.

"AUTO STORAGE BATTERY." A book that tells in simple language all about the care and repair of storage batteries. $5.00.

Your Jobber Should Have These In Stock. If he cannot supply you write direct to

IMPORTANT POINTS ABOUT PAINT AND VARNISH BRUSHES

A Set of Three Brushes and the Automobile Dealer and Repairer for One Year for $2.00.

Showing Brushes One-Half Actual Size.

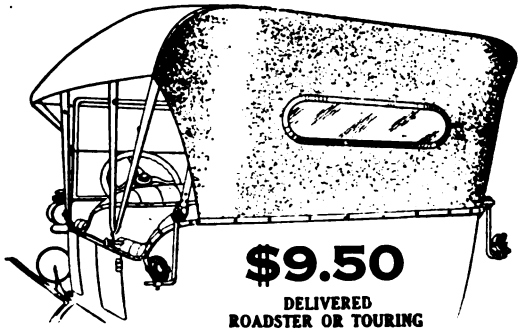
Did it ever occur to you that there was much difference between a good paint or varnish brush and a poor one? Probably not. To most people a brush is just a brush Yet an analysis shows that there is an almost measureless difference between a good brush and poor one.

For instance, a properly made Flowing Fitch brush is hermetically sealed, so as to keep the paint, or whatever may be used, from getting into the brush at the top and loosening the hairs. All such properly made brushes are solidly set in glue cement inside a leak-proof ferrule, and a whole row of neatly clinched nails are driven in at the end of the ferrule to give added security, and a guarantee that the hairs will not pull out.

A Fitch brush is *smooth*, *soft*, and *flowing*, and does not "mush" up or get flabby like a cheap brush, but holds its springiness. The trouble with cheap brushes is that the ferrule is nothing more than a single band of tin, open at the top, with a couple of nails jabbed through. When you use such a brush the cheap hair will pull out and scatter all over your work, because it is not held securely enough to stand the drag of the brush in painting or varnishing.

A brush may be washed with gasoline or kerosene oil, but to clean it thoroughly turpentine should be used. No brush used for painting should be used for varnishing.

We have recently made arrangements with one of the best manufacturers of these properly made brushes in New York to offer a set of Three in connection with a subscription to the AUTOMOBILE DEALER AND REPAIRER for a year for an even $2.00, except in the 7th and 8th zones the price is $3.00, the subscription rate being $2.00 for a year. These zones comprise the following states: Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, South Dakota, Oklahoma, Oregon, Utah, Washington and Wyoming; also Canal Zone, Guam, Hawaii and Porto Rico, Samoa, Virgin Islands. These brushes sell at retail for $1.40. It will be seen, therefore, that there is a substantial advantage in sending to us for the AUTOMOBILE DEALER AND REPAIRER for a year, and for a set of these brushes.



Present subscribers can have their subscriptions extended for a year, and secure a set of brushes, on the same terms. These brushes are guaranteed in every respect, and though they cost more than cheap brushes would cost, they are far cheaper in the end, because of their lasting qualities and the good work that can be done with them. No man can afford to waste expensive paint and varnish on any vehicle by using a cheap and poorly constructed brush, such as is usually to be found wherever brushes are sold. The ordinary dealer in brushes himself as a rule has very little knowledge of the quality of the brushes he sells.

Remit by check or money order, and your name will be entered as a subscriber to the AUTOMOBILE DEALER AND REPAIRER for a year, and a set of these brushes, which are just the right size and shape (see illustration, which is exactly one-half the actual size of the brushes,) will be sent to you, postage prepaid.

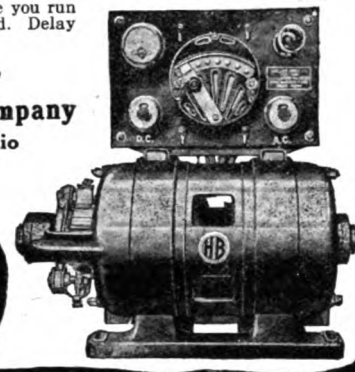
Profits in HB Battery Charging

The demand for service in recharging auto storage batteries is constantly increasing. There are big profits for you all the year round, but cold weather, heavy starting service and excessive use of lights makes battery charging profits run highest when other business runs low. Other garages, with no better opportunity than you, are clearing

$100 to $150 Extra Profit Every Month



Some are doing even better than this. What you can make depends entirely upon yourself. This HB 500-watt Charger will recharge from 1 to 7 batteries at once, with current cost of only 12c to 15c per battery. Autoist pays 75c to $1.50. Anyone can operate. No electrical or mechanical experience necessary. Will recharge any make or size storage battery quickly, successfully and profitably.

$15 Puts This Money-Maker in Your Garage

Balance in 9 monthly payments of $20 each, which earnings should easily pay, with big profits besides. Write for full particulars or send $15, first payment, with trial order. Under absolute money-back guarantee you run no risk in ordering from this ad. Delay simply means lost profits.

WE TRAIN YOU

TO BE AN EXPERT TIRE REPAIRMAN

A BUSINESS OF BIG PROFIT FOR YOU.

The tire repairing business is one of the most profitable in the automobile industry. A large investment in equipment is not necessary, while a large and quick turnover is assured. There never was a time when tire repairing was as important as it is today, and never before have experienced repairmen been so scarce.

We Help You Develop A Profitable Tire Repairing Business

Through our course on tire repairing and shop management we give you expert training on all the problems of tire repairing, vulcanizing, and the administration of your business affairs. Our course goes right to you in your home, where you will not lose valuable time away from your work. It is the most complete, inexpensive, and practical tire repairing course in existence. We guarantee to train you to be an expert tire repairman in three months so that you can repair fabric tires, all makes of cord tires, big pneumatic truck tires and tubes.

We show you every operation in making repairs. Every point is explained and make clear with drawings and photographic reproductions. We show you how and where to get the best equipment for doing the work, how to operate a shop on the most economical basis, and how to advertise and develop a highly profitable business. Write today for free folder T3.

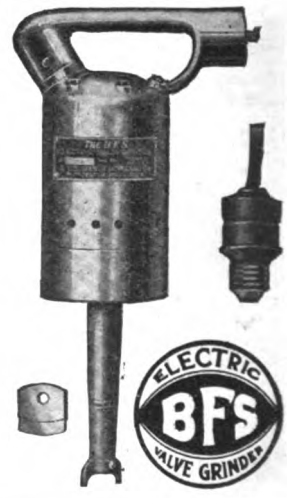
PLEASED?



WHY OF COURSE HE'S PLEASED WITH

B·F·S·

VALVE GRINDER

You too will be pleased—it's a better way of grinding valves—it's quicker and more uniform results are obtained. Hand valve grinding is a slow, tiresome, tedious, money losing job—naturally, it's out of date—a thing of the past.

It took some years for The B. F. S. Grinder to arrive at its present state of perfection. In operation, the familiar oscillating motion employed in hand grinding is followed, but at a speed not attainable by the hand method. 800 to 900 oscillations per minute are developed.

Rear valves on Ford motors are reached with ease without special attachments. Tiresome jobs, if they can be done quickly, become a pleasure—and that is why B. F. S. is bound to please.

It meets the strain of continual usage in the hands of the average garage employee.

Yes—it is true, you can walk to Chicago—but you get there quicker if you go by train. Same difference between hand valve grinding and the B. F. S. System.

GET A GRINDER THAT WILL PLEASE. *Write for full particulars.*

Have You Had Trouble With Your Tires?

The fault is not with the tires. You, or your chauffeur, or both, are to blame. The responsibility is yours because you should keep the tires pumped up to a specified pressure, and don't.

Tires that are kept up to the proper air pressure last twice as long—sometimes ten times longer—than tires that are run with not enough air in them. Measure your air daily with a

SCHRADER UNIVERSAL TIRE PRESSURE GAUGE

and get out of your tires all the miles they can give.

Price in U. S. A. **$1.50**

"LITTLE GIANT"
GEAR AND WHEEL PULLER

SAVES TIME—SAVES MONEY—SAVES TROUBLE

BECAUSE you don't have to hunt through your "kit bag" for a suitable tool—don't have to waste time. Any gear, wheel, pulley or bearing—big, little, inside or out—comes off in a hurry when the "LITTLE GIANT" takes hold of it. A powerful—all purpose puller. Wonderful one puller for all pulling work.

BECAUSE no waste effort—no long-drawn-out performance. "LITTLE GIANT" needs no wrench to hold in place. Never slips—never twists off. The harder the pull, the tighter the grip. Quickly adjustable up to 13 inches. Gives quick—powerful action.

BECAUSE the "LITTLE GIANT" is a life-time device. Constructed of tough drop forged steel. Nothing to wear out or get out of whack. The biggest pulling worth—biggest service worth ever packed into a single appliance.

In use in leading shops and garages. Price, $10. Money back if not satisfactory. Order from ad. or write for descriptive matter.

STOP THROWING AWAY
Your Money and Time!

BUY — Scientific Spark Plugs

Patented Feb. 5th, 1918

Recommended by Government engineers for military service.

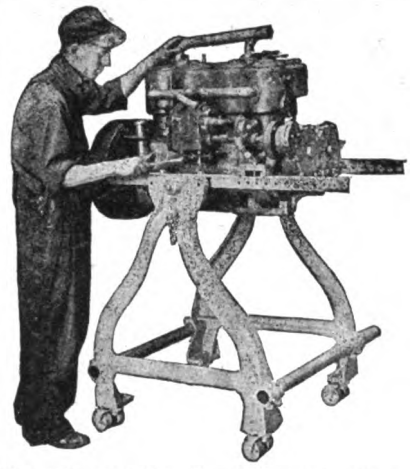
The king of oil-proof Spark Plugs, made from the best of materials and fully guaranteed.

Their special patented construction places them in a class by themselves and gives to them oil-excluding features possessed by no other plug.

They have no equal for Power, Efficiency and Economy. Why bother with dirty missing plugs on your motor trips, when you can get a plug that is more economical for you to use than the common cheap ones?

Every part of these plugs is accessible for cleaning, and extra porcelain can be purchased at the small cost of 20¢ each.

The whole secret lies in the thin extension on the bottom of the plug which burns away the oil and prevents it from reaching the interior of the plug and its sparking points.



Once used, always used. Special prices on sets of plugs to users in new territory. **Price $1.00.**

Dealers, get our prices on this great seller.

89 pages and 291 illustrations on Engine and Parts.

16 pages on Digest of Troubles.

6000 lines to the Index. This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. **Index begins on colored paper,** easy to refer to.

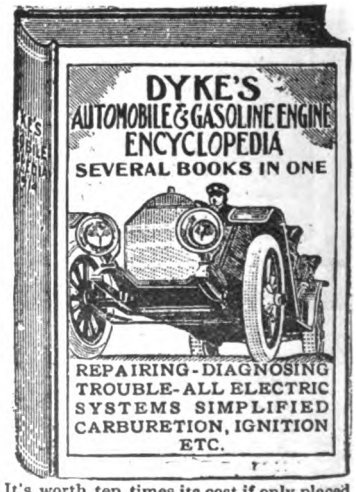
Dictionary is also included, which gives the meaning of motoring terms.

Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

NEW ADDITIONS
TRUCKS, TRACTORS, MOTORCYCLES, AIRPLANES AND AIRPLANE ENGINES.

Price $3.82, Prepaid, Express.

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

Make $6,000.00 to $8,000.00 per Year with Less that 1,000.00 Investment by Retreading and Rebuilding Old Worn Tires on the Zwebell Retreader

The New Improved

ZWEBELL

Single-Cavity Retreader and Tire Rebuilding Machine

Get into This Profitable Work NOW—Ahead of the Other Fellows

Clamps are large in size and thick, giving long thread area. Screws are 1 in. with square threads (commonly called vise threads) avoiding danger of straining threads. This adds endurance and strength to both screw and clamp.

Pop valve, gauge, gauge glass, fixtures, burners, valves, bags, etc., are furnished complete and of best materials obtainable.

Boiler is Sheet Steel, Complying with State Boiler Codes

Will stand almost unlimited pressure—each undergoes a thermostatic test directed by an insurance inspector. Boiler laws are practically universal, for no cast-iron boiler can be operated safely with over 15 lbs. of steam pressure. Beware of Cast-iron Boilers.

Cavities are Cast Singly—machine is designed to operate with one, two or three molds, as desired. Flanges are all same size and interchangeable. Molds are free from flat surfaces and square corners. Circles are designed to avoid impressions at end of cure, and cavities being shallow, crushing of beads is avoided.

Manifolds are furnished in the 3-way type as our standard machine. A 1-way manifold will be furnished where only one mold is desired to start with. If two molds are desired, the 3-way manifold will be furnished with the center outlet plugged.

Manifold is of massive construction with plenty of area for steam and return of condensed steam.

Before

Turn this worthless tire into this one—looks like new →

After

Complete outfit ready to start work—we show you.

Send for full details and sample section of Retreaded Tire.

Get in while the getting is good. Today may be none too soon.

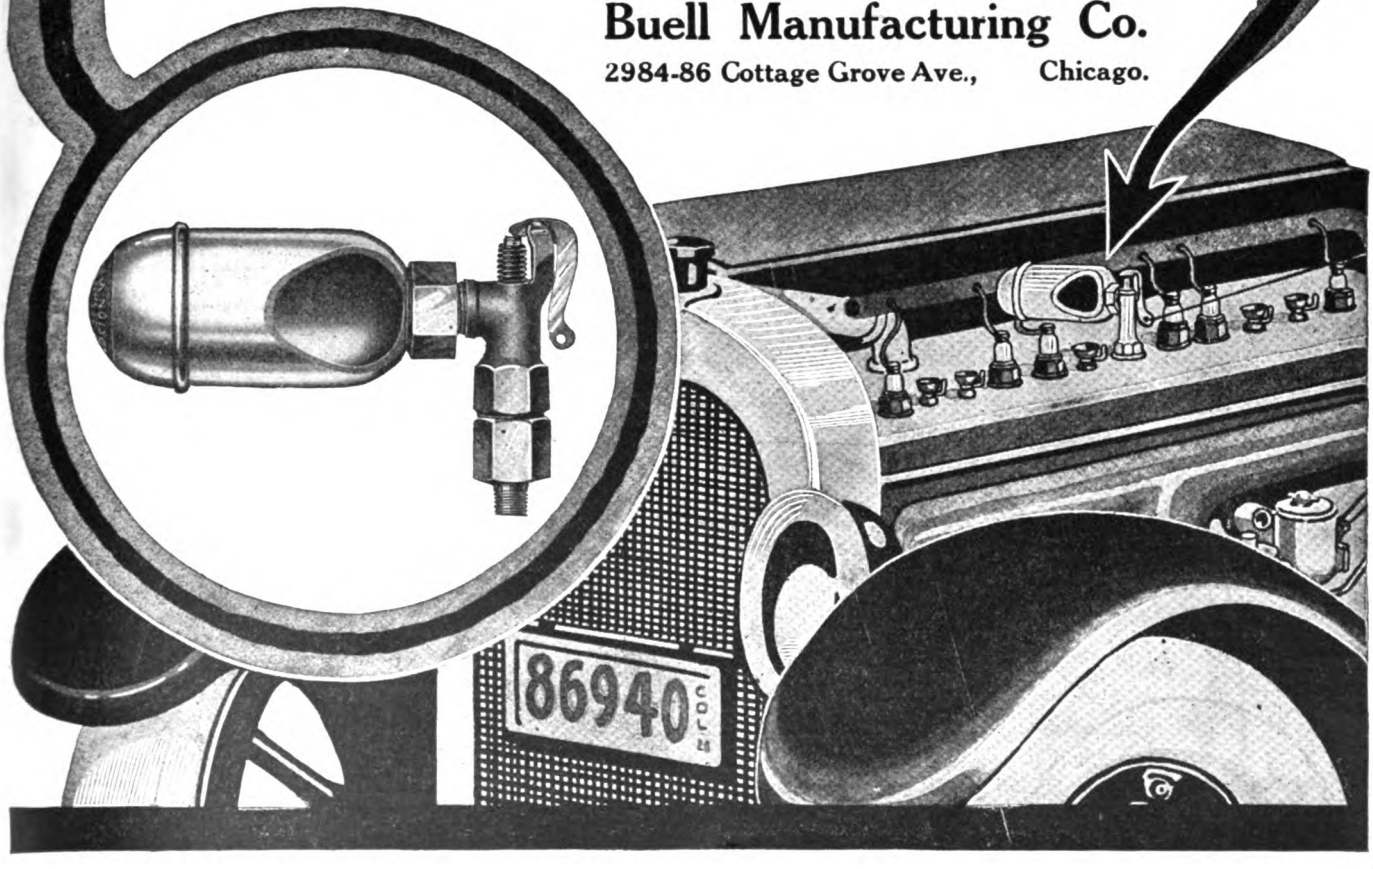
DEALERS

Here's a Big, Profitable Seller



This is the best selling, most practical auto signal of the day—because:

1. It is attached directly on the motor in the priming cup opening, securing full explosion pressure of the engine.
2. Its clear, insistent, far-reaching blast penetrates above all other sounds and attracts instant attention.
3. Easy to operate, sensitive to the slightest touch of the whistle cord, never needs adjustment, GUARANTEED for 10 years.

BUELL EXPLOSION WHISTLE

Is standard or optional equipment on the passenger cars and motor trucks of 41 manufacturers, including Pierce-Arrow, Mack and Diamond T. This is an auto signal you can confidently recommend. Its superiority over all other warning devices is demonstrated in its adoption by the above-mentioned manufacturers. If you are not already handling this popular signal—write at once.

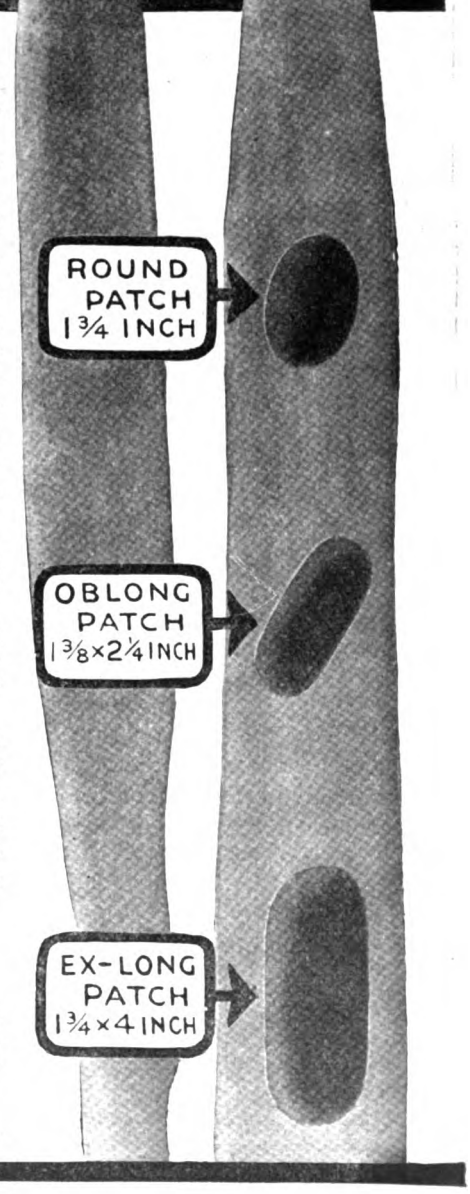
SHALER

5 MINUTE GARAGE VULCANIZER

Makes 4 Repairs in 5 Minutes

This new gang vulcanizer was designed especially to meet the demand from Garages and Repair Shops for a quick action, large capacity, dependable vulcanizer, that uses the convenient Shaler Patch-&-Heat Units. These handy units are very popular. Over 10,000,000 punctures were repaired with them last year. No other method is so quick, safe, convenient and satisfactory.



The Shaler Patch-&-Heat Unit—always ready for instant use—saves time and prevents delay. It is a complete unit—a compact combination of chemical fuel, vulcanizing pan and raw rubber patch. You simply remove the linen protection from the patch, clamp it over the puncture, light the fuel, and in 5 minutes you have a permanent, feather-edge repair, stronger than the tube itself—one than you can guarantee.

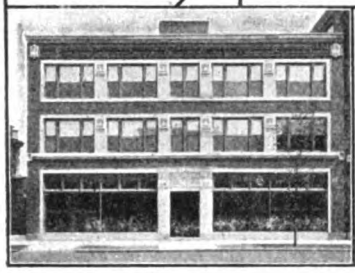
Free to Repair Shops

To quickly introduce this wonderful new Shaler Garage Vulcanizer—we will send *Absolutely Free*, with each outfit—an assorted supply of Shaler Patch-&-Heat Units, that will make repairs enough to more than pay for the outfit.

Our low List Price $10 is subject to 30% trade discount, making the Net Price to you only $7—and with the outfit we will send you Free Patches enough to more than pay for it, so that outfit costs you practically nothing.

You can obtain garage size, Large Packages of Shaler Patch-&-Heat Units from your jobber, at prices so low as to make this the cheapest method of vulcanizing. And there is no danger—no gasoline, no blaze, no flame, no trouble, no waiting to heat a vulcanizer.

Write Quick—or Ask Your Jobber



for full information about our Liberal Introductory Offer. This is a limited offer, for a short time only, to introduce this new Garage Vulcanizer. Take advantage of it now. You risk nothing, because we will send you Free Patches enough to more than pay for the outfit. Write now, and give us your Jobber's name, for full information.

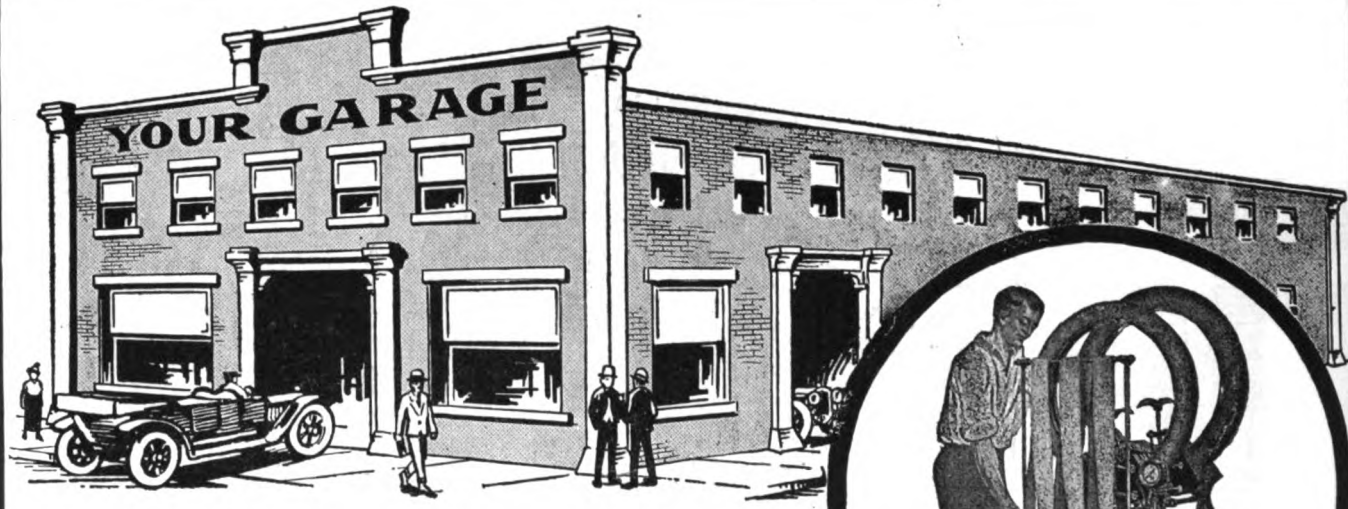
The Rim That Carries "Giants" Is Fit For Any Job

IF proof had been needed of the supremacy of Firestone Type C Rims for pneumatic tires it has been afforded by the success of these rims with Giant Pneumatic Truck Tires. Here, as on high-grade passenger cars, the established features of Type C Rims have shown their strength, their economy, and their practical, every-day convenience.

You remember these superiorities:

1. Continuous, one-piece base.
2. Continuous surface contact with felloe.
3. Continuous removable side ring with split locking ring.
4. Rim mounted on wheel with continuous wedge ring, the foundation principle of Firestone Rim success.

One man can make a tire change of the largest truck pneumatic tires when mounted on Firestone Type C Rims.



Firestone Type E Rims are just as successful in their field, for light cars.

If you want most mileage, least "grief" and greatest ease and convenience of tire change, see that your pneumatic tires have their foundation in Firestone Rims.

DEALERS—Add Tire Repairing to your present business, *because:*

First—Tire repairing, like motoring, goes on all the time and brings in a steady return of profits—*three times* the percentage your average on selling motor cars.

Second—It helps you to hold *all* the business of your present customers, and to win more and more new ones.

Third—You can start on a very small outlay, and add new equipment as your business grows; the work is quickly done, and once started, it grows fast.

STAYBESTOS MFG. CO.

5541 Lena Street, Philadelphia

The "Modern Factory" equipped to make all types of brake lining and all widths up to 6 inches

Digitized by Google

Every year thousands of accidents occur to cars either towing or being towed.

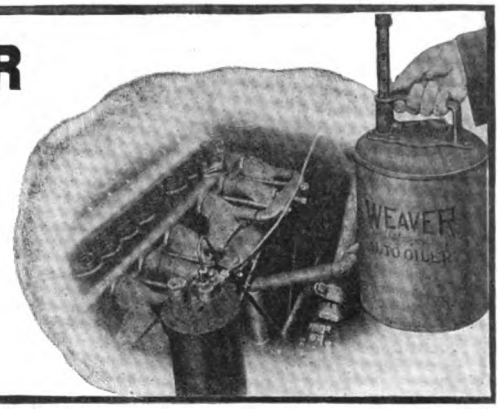
THE MAIN CAUSE of these accidents has been the old-fashioned, flexible tow-line. When a short rope was used, sudden stops often meant that the towed car smashed into the towing car. This was especially true if the brakes of the rear car were out of order or failed to work instantly. Where a long rope was used to reduce the possibility of jamming, pedestrians have been tripped and run down, and another car coming suddenly out of a side street has on hundreds of occasions collided with tow-line. Anyone who has ever had to do with a disabled car will appreciate these conditions and realize the value of this new Weaver Appliance.

The Weaver Towing Pole is made of heavy, double strength steel tubing, and is adjustable in length from 5 ft. 6 in. to 8 ft. While the pole is sufficiently rigid to enable it to control the rear car, a coil spring, applied in such a manner as to provide tension both ways, absorbs all shocks from sudden starting or stopping.

To attach the Weaver Towing Pole is but the work of a minute. A 36-in. chain is employed to lash around the "V" shaped socket, and a heavy woven pad prevents either chain or socket from marring finish of car. Chain is held by a secure spring plunger.

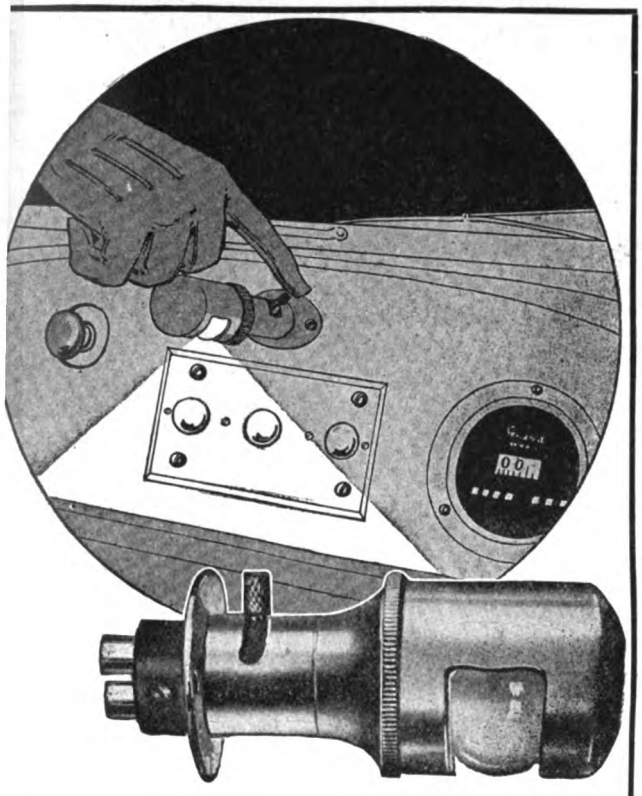
Don't tempt fate any longer by using ordinary tow-lines. The damage caused by one small accident will cost more to repair than several Weaver Towing Poles, and the poles will last a lifetime.

Write NOW For Catalog describing this article and also the entire Weaver Line of SHOP EQUIPMENT. Modernize your garage by Weaverizing it and you will be able to lend many mechanics to Uncle Sam and still handle your usual run of business.



WEAVER MANUFACTURING CO., -- 2175 South 9th Street, -- SPRINGFIELD, ILLS.

THE WEAVER AUTO OILER



Does entirely away with the dripping measuring can and the dirty funnel. You fill the Weaver Oiler and place it alongside your gasoline tank. When a man wants oil, you merely twist the spout to conform to the position of the oil opening, press a button and watch the indicator till the desired amount is registered. Then you release pressure on the button and turn the spout back to its normal position.

Saves time, saves oil, guarantees accuracy, eliminates dirt, Both you and your customers will appreciate the Weaver Auto Oiler. Order one for every grade of oil you handle. Read its full description in our complete catalog.

Connecticut "P S" Dash Lamp

This is the most modern type of Dash Lamp on the market—a complete piece of equipment, better in every way than the ordinary Dash Lamp in that its control switch is incorporated in it, thus obviating the necessity of an extra controlling switch and a more or less involved scheme of wiring.

It is substantially made, heavily nickeled and beautifully finished.

People are quick to appreciate the superior practicability of such a lamp and it finds a lively sale with all classes of motorists.

QUICK SERVICE

remove, *v.* To move or cause to be moved out of a place; transfer from one place to another; as, to *remove* a tree.

consume, *v.* To destroy gradually, as by burning, eating, etc., or by using up or wearing out.

—*Standard Dictionary*

Are you getting your "money's worth," or are you "removing" the carbon deposits—"as, to remove a tree"?

When carbon deposits are "removed" from automobile cylinders, just that much gasoline has been **poured on the ground.**

When carbon deposits are "consumed" from automobile cylinders, **every bit of power** contained in the gasoline has been **utilized.**

CARBON-X

The Guaranteed Carbon Consumer

Causes the carbon deposits to be **consumed as fuel,** and the **power** thus derived is **delivered at the crank-shaft.** Carbon-X is **not** a carbon "remover"—it is a carbon **consumer.**

Since the carbon deposits represent that portion of the gasoline which has not delivered its quota of power to the crank-shaft, it readily will be seen that Carbon-X is an important factor in the proper conservation of gasoline.

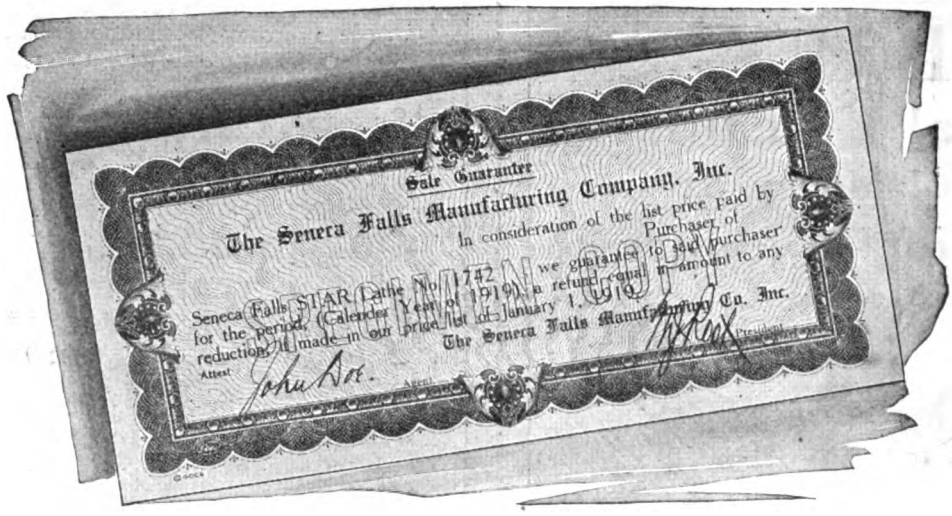
Carbon-X is easy to use

The services of an expert mechanic **are not required**—nor is it necessary to "lay up" the car—when using Carbon-X. Being made in tablet form, it is only necessary to remove the spark plugs after warming up the motor, insert the desired number of Carbon-X tablets according to the very simple directions on the carton, replace the spark plugs, and **drive the car.**

Carbon-X positively **will not injure** the interior of any motor, nor affect the lubricating oil in any manner. There is nothing about Carbon-X that can cause trouble—anyone who can handle a spark plug wrench can apply Carbon-X and obtain **real results.**

All argument as to whether Carbon-X "will do the work" has been **eliminated.** This unqualified and unprecedented guarantee is printed on every carton: **"Every package contains satisfaction—money refunded if you don't find it"**—and it means just what it says. The user's decision is final.

MR. CAR-OWNER: Many dealers have not yet stocked Carbon-X. If your dealer cannot supply you, send us his name and a dollar bill and we will mail you the regular $1 carton containing 30 tablets postpaid.



MR. DEALER: To save time, order a dozen cartons of Carbon-X direct, giving us instructions to bill through your jobber. Initial order will be shipped prepaid.

MR. GARAGE MAN: If your territory is not already covered by Carbon-X Service, ask about this big-money-making, bring-'em-back-for-more Carbon-X Service Station plan. It's different.

Ask for our unusual booklet—"WHY IS CARBON?"—it's free.

"NORMA"

"NORMA" PRECISION BALL BEARINGS

(PATENTED)

The lowest cost per mile or per hour service—the period of reconstruction makes this an ideal toward which builders and users of cars, trucks, tractors, power boats and airplanes must strive. And in the effort toward its attainment, no small part is played by the electrical equipment of these automotive units.

Dependable ignition and dependable lighting are prime essentials to dependable, low-cost service. Which explains why builders of high-grade ignition apparatus and lighting generators, in standardizing on "NORMA" Ball Bearings, have so generally availed themselves of the proved "NORMA" dependability in speed service.

A Tire That is Puncture Proof

The Result of Ten Years' Testing

After these ten years of experimental labor and crucial tests our efforts have been rewarded. The results are that the **Brictson Tire** is proving itself a revelation to the motoring world.

It Solves the Tire Problem

Because it is—puncture proof, blowout proof, skid proof, rut proof, rim-cut proof, oil proof, gasoline proof, trouble proof.

10,000 Miles Guaranteed

Can you beat that? Many motorists will say, "I don't believe the tire is made that will run me 10,000 miles." Our emphatic reply is, "There is *one* that will do it—and that's the **Brictson.**" With every tire sold, we give a **Specific, Written, Service Guarantee for 10,000 Miles.** Of course, we could not make this exceptional offer had we not put **Brictson** Tires through the various crucial tests that have proven their superiority beyond all question. For the man who doubts, we will do more than that. We will allow you to

Try It First—Before You Pay

The combination of our 10,000 mile guarantee, our puncture proof guarantee and our unprecedented "try it first before you pay" offer, makes our proposition overshadow any project ever before attempted in the tire industry. We offer to let you try **Brictson** Tires on your car **At Our Expense.** Could a manufacturer offer a greater proof of confidence?

Retread Your Present Tires

If you have some new tires at the present time, apply **Brictson Treads** and make them puncture proof, blowout proof, skid proof, rut proof, rim-cut proof, oil proof, gasoline proof—**Trouble** proof. This will convince you of **Brictson** quality and will mean that for the future you will use nothing other than **Brictson** Tires.

Or, you no doubt have in your garage a few old casings where the rubber tread is worn thin. Here is your opportunity to apply **Brictson Treads,** making them proof against all road troubles and get a good long mileage from them.

Don't bother about writing a letter. Just clip the coupon at left, fill it in and mail to us **Today.** It puts you under no obligation.

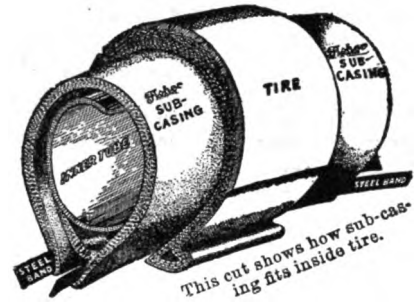
MORE MILES PER TIRE

LESS TIRES TO BUY

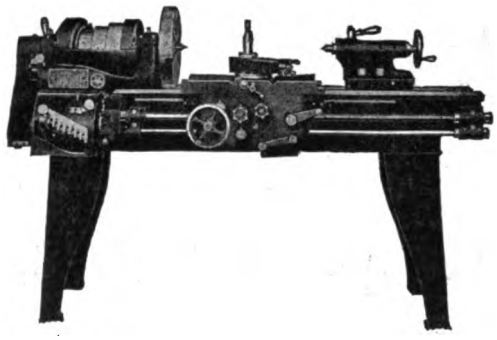


THE Fisher PATENTED "RIM-GRIP" SUB-CASING

The Blows That Your Tires Receive, When You Strike Objects in the Road, Leave Weakened Places in the Fabric

A TIRE IS AS STRONG AS ITS WEAKEST POINT

The weakened places are hard to detect now, but will result in blow-outs later.



RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings.

This cut shows how sub-casing fits inside tire.

"NO-LEAK-O" PISTON RING CO.
AUTOMOBILE ACCESSORIES CO.

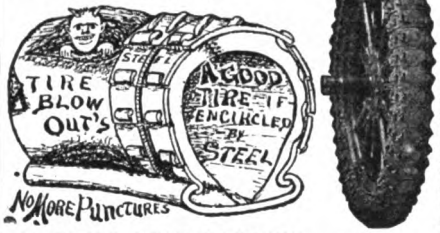
Balletin No. 5

REFUSE

It is said gasoline contains about 20 per cent. coal oil. This coal oil will not vaporize under normal conditions. It works past the piston ring down into the oil pit, weakens lubrication and if not emptied frequently, the crank-shaft bearings are injured.

By reversing our top ring (groove part up) this coal oil attempting to pass is trapped in the groove. (See Letter A.) On the firing or power stroke it is drawn into the heated firing chamber by capillary attraction It will then be exploded into power; or go out the exhaust pipe and not down in the oil pit, injuring lubrication. **No other ring accomplishes these results.** This reversing of the top ring increases the compression and power of the motor, because the film of oil caught up by the square edge, on the compression stroke, makes a more nearly perfect "Oil Seal."

Mr. Repairman, Listen! This is Your Harvest. Don't Neglect It.



There are over 4,000,000 automobiles in the United States, say nothing of commercial trucks, tractors, etc. Old cars are being rebuilt. *War or no war* they must be kept running. "No-Leak-O" "oil SEAL ing" Piston Rings are *unlike anp other ring* on the market. Simple, *one piece*, tough and springy, easy to install, not liable to break, and popular in price. *Send a trial order at once.*

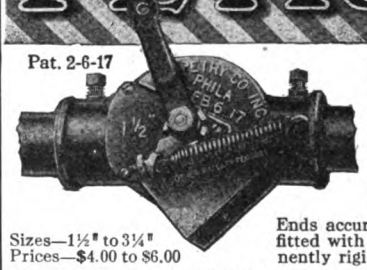
Pierce Governors

The Truck Industry's Chosen Standard



Eighty-nine motor truck manufacturers furnish Pierce Governors as regular equipment—over 50 per cent more than are using all other makes of governors combined.

"There's a Reason"

Pierce Governor Co.
Anderson, Indiana, U.S.A.

PETRY CUT OUT

Pat. 2-6-17

Gases expelled to the rear through patented flared opening, prevents all back pressure. Lever has seven adjustments, which make easy installation. Spring is away from the body of the Cut-out, does not absorb heat, has a simple tension adjustment and easy action, no strain on the exhaust pipe.

Ends accurately machined for pipe size and fitted with set screw, which insures a permanently rigid installation.

Sizes—1½" to 3¼"
Prices—$4.00 to $6.00

KEEPING JIM ON THE JUMP

In ancient Greece, there lived a man with whiskers long and white; a sage of wit, but ridiculed, he slept in tubs at night.

This ancient man, so history tells, had one peculiar passion; to find a man of honesty, became his one obsession.

From morn 'till night, Diogenes (that was his name you've guessed), on highways wide, in alleys dank, pursued his fruitless quest.

A lighted lantern in his hand, a frown upon his brow; the old man wandered on and on and hunted high and low.

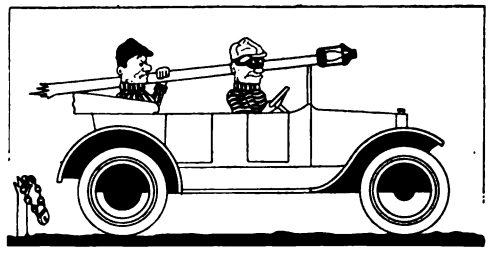
In rich man's house, in poor man's dive, the sage could oft be found; his search he never ended 'till he slept beneath the ground.

* * *

The memory of that ancient man long since has passed away; but still a question vexes me,— "Does virtue thrive to-day?"

Had that old sage immortal life would he have reached his goal? Could he have found in this fair age a man with honest soul?

I doubt it much, my wager's great that old Diogenes would long ago have ceased his search and rested his old knees.



Permit me, now, to change a bit an adage old and clever: "Though wise men come and fools may go, the thieves go on forever."

* * *

IF I chose to delve into the musty past I am sure that I could convince the average reader that dishonesty is as old as history and that it has flourished since time immemorial. Just to show you what can be done in the way of proof let me refer to the book of Genesis. Is it not faithfully reported that our old forefather Adam purloined an apple from the orchard? Well, that was only the beginning.

As we turn over the pages of the book, we find tale upon tale of wars and trouble; Solomon had his vices, Isaiah made mistakes, Saul was possessed of the "itching palm," and soon we are forced to admit that every age has had its troubles.

Old Diogenes probably was the first man to investigate human nature to such a great extent and take his findings much to heart. His search was so unique and so different that a note was struck and the tone has vibrated down through history until to-day.

Men who were not so philosophic by nature flourished in Diogenes' day, in all probability they owned their palaces and had their diamonds, simply because they took for granted that they must look out for the thieves. But poor old Diogenes! There was a man to be sorry for! Had I the gift of Mary Pickford or Norma Talmadge, I would weep a tear for the old man, possibly I would squeeze out even two or three pearly drops, for Diog. certainly needed sympathy.

I can picture his look of trust, his patient and serene face as he plodded about his endless task. Shorn of everything but his old

Digitized by Google

rusty lantern and his sleeping tub, he wandered around, putting his trust in human nature, only to meet with disappointment wherever he went.

It is a lesson to be taken to heart, a horrible example. Picture in your mind what might happen to such a trusting mortal were he to be placed in one of our towns or cities to-day. Some healthy and robust youngster would seize and make way with his tub, before Diogenes had gone more than a block from the station. The young-

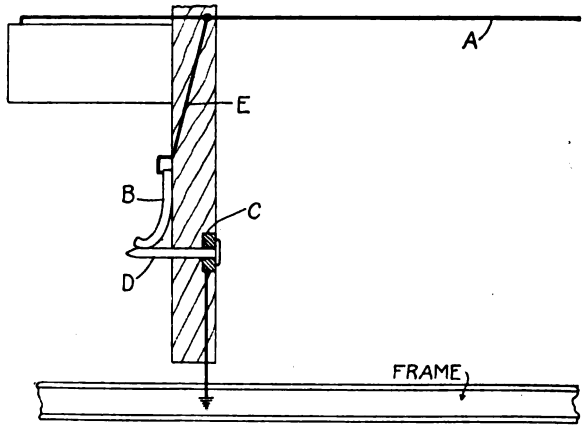


Fig. 1—The Easiest Way To Discourage the Thief Is To Short-Circuit the Coil.

ster would doubtless use the tub as a boat or perhaps a roof to his rudely constructed shack.

After traveling two blocks, Diogenes would miss his rusty lanter, a junk dealer, in passing might snatch it from his hands. The old clothes man would soon acquire the old philosopher's raiment and if Diog. were a deep sleeper he would awake in the morning to find that during the dark hours an enterprising wig maker had purloined his luxuriant whiskers, mayhap his hair also would be missing. The morning papers would contain the scandal, covered by a line in the police reports. You and I, brother reader, would smile to ourselves and snicker, we would think to ourselves, "Another lamb fleeced—poor fool," and the old world would keep right on running.

But "Pride goeth before a fall" and soon you and I, brother reader, might stub our toe and dislocate our nose upon the asphalt paving. We might trustfully leave our shiny new Fierce Sparrow or our pretty new Appleson car beside the curb while we visited a friend in town and when we returned find nothing but a grease spot or the track left by four non-skid Fearsome tires.

In old Diogenes' day the thief was content if he could purloin a nose-ring or an ankle bracelet, but the "Jim" of modern times is after bigger game, he is modernized and keeps up with the times.

Now before you read any further I want to impress one thing upon your mind, I'm not going to give you a receipt for preventing theft—there is no such thing; I'll just try to tell you, as the title reads, how to keep "Jim" on the jump.

If Jim wants your car, he'll take it, you can remove the wheels, take out the engine, drink the gasoline and chain the auto to a post, all in vain. Jim will come along, make a careful inventory of the accessories and decide whether or not the "Game is worth the candle," to borrow an old saying. If the answer is "Yes," your little car will be advertised as lost or stolen and you will collect the insurance.

Perhaps Jim will add insult to injury and take the lamp-post as well, just to show you how easy his job really is. Right here let me warn you of one thing, for goodness' sake don't chain the axle of your car to a lamp-post for if you do Jim will remove a wheel, slip off the chain and when the wheel has been replaced, drive away your little pet.

The Best One I Know

First, I'll give you the best thief discouraging method I know; there is really no absolute, guaranteed, ironclad thief preventive. Hire a chauffeur to watch your car, hire a footman to watch the chauffeur, pay a butler to watch the footman, interest your wife's maid in the butler, secure the services of a boy to keep tabs on the maid, and watch the boy yourself. It costs money, but it's worth it if you own a real car.

Of course if you own a cheap car, one of the kind that you can pick up for a couple of thousand dollars, you really should depend upon cruder methods. I once had a friend who invented the best thief discourager that I have ever seen. He connected the starting button with a small electrical device and a secondary coil in such a way that when the button was pushed in a spark would occur in the gasoline tank. Yes, it worked to perfection. Bill forgot to turn off the switch one day when he started the car himself, and when matters were care-

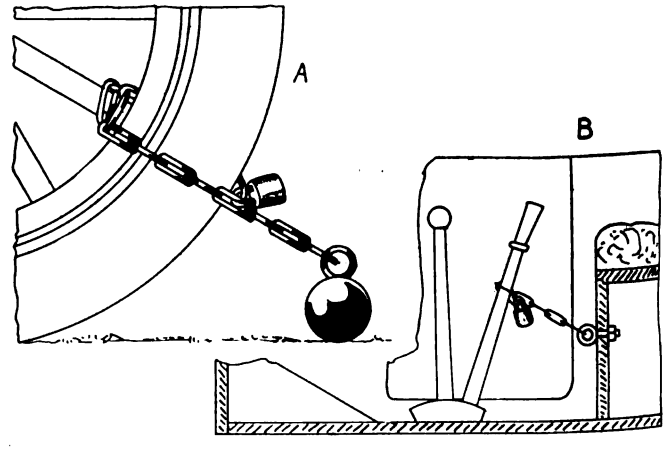

Fig. 2—A Heavy Ball and Chain, Swinging with the Wheel Would Attract Attention. At B Is Shown Method of Fastening Lever.

fully explained to the fire insurance company they wouldn't listen to reason and refused to pay on the policy.

Bill always contended that his device worked, everyone admitted it, and you will admit that there was little chance that the car could have been stolen. Bill has a number of similar schemes and should any of my readers want more details I will be glad to supply them.

Digitized by Google

Perhaps, however, you do not carry insurance upon your car, perhaps you have a conscience and in such a case the device such as I have mentioned will not answer the purpose. Just glance at Figure 1 and see just how a somewhat similar arrangement may be made.

In Figure 1 the wire A leads from the ignition coil to the battery or ignition switch. Should this wire be grounded, then the ignition coil becomes inoperative. Therefore let us connect this wire, through the wire E

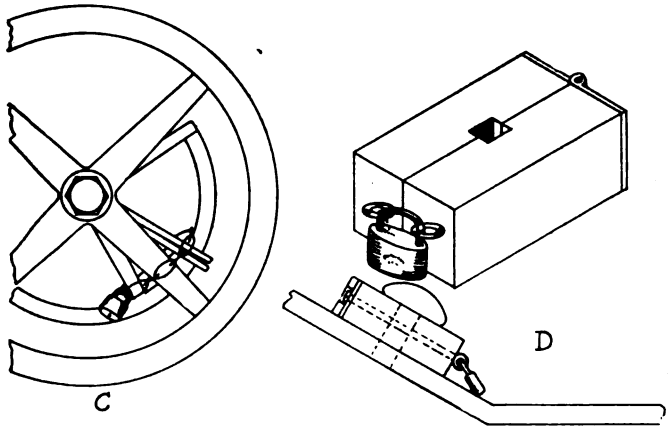

Fig. 3—C, Illustrates Spark and Throttle Levers Locked; D, A Block of Wood Locked Beneath the Starting Button.

to a small strip of spring brass, B, making the connection inside the dash so that it will not be noticed by the casual observer.

On the opposite side of the dash, inside, we will sink a small washer, C, which is just large enough to permit the insertion of a nail, D, and then connect the washer C with the frame, through the dashboard if possible.

Should the ignition switch be turned on, all the ignition current will short circuit through the frame if the nail D is in place and the engine cannot be started. When the owner wishes to start the car, he simply removes the nail, turns on the switch and starts the engine.

With a few variations the same scheme may be used in a number of ways. For instance, instead of connecting the washer C with the frame, connect it with the horn, or a special electric bell. As soon as light-fingered "Jim" turns on the switch, buzz goes the alarm and "Jim beats it while the going is good."

Locking the Ford.

If you are so fortunate to own a Ford car, you will adopt about the same methods. In such a case, however, you will connect the wire E with the wire which leads to the magneto terminal, or better still with the ignition switch bar.

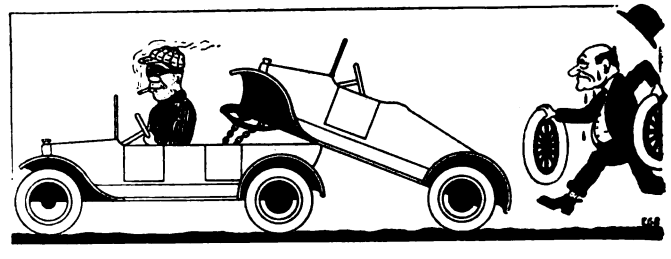
You surely can have a lot of fun with "Jim" if you choose, especially if your car is one that has to be cranked by hand. Just change around the secondary or spark plug wires, or disconnect the linkage between the spark advance lever and the ignition timer or distributor. When your friend tries to crank the car he will be surprised to receive a broken wrist or a sprained back.

Bear in mind, however, that you car is not an animate object; it knows no master and is just as ready and willing to kick you as the thief, no matter how kindly you treat it.

Where the car is fitted with a single coil and distributor system, a discouraging factor for the thief is the loss of the distributor brush. The owner can easily lift off the distributor head, remove the brush and replace the head again. The thief will not find it easy to put in a new brush, though he can, of course, tow away the car.

As I have hinted before, you may mix up the ignition system or shut off the gasoline, Mr. Thief will find some other way of running away with the car if he wants it hard enough.

In Figure 2 there are given two discouragers that are very effectual. The one shown at A is borrowed, not original. It is similar to the method used in preventing prisoners from escaping, back in the dark ages. It is simple enough, nothing more or less than a ball and chain, locked around a wheel of the car. But just try to run the car with the ball attached, you will make such a clatter and racket that you will be fully persuaded as to its effectual operation.

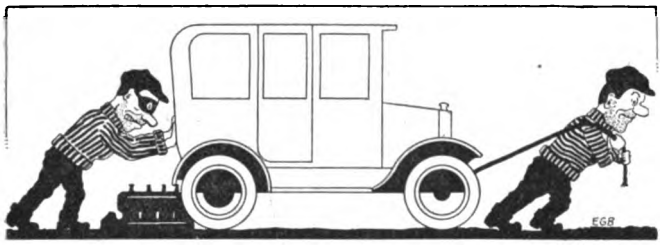


I have in mind a similar device which can be obtained on the market, a wedge-shaped iron which locks around the tire. The car can be moved a short distance, but not operated very satisfactorily unless the device is removed.

At B in the same figure is shown a popular locking method. The emergency brake lever is held back against a staple or eye-bolt fixed in the seat. Personally the writer prefers to lock the gear-shift lever into high speed by the same means, but in such a case, if there are two thieves, the clutch can be held out while the other cranks the engine, and the car started on high speed, if the engine is powerful enough.

A Clever Lock.

Not long ago I noticed a clever locking arrangement which appeared to be about as effectual as anything could be. The owner had placed a large eye-bolt through the front axle, near to the left wheel spindle. He had the eye-bolt welded into place so that it could not be removed. When the car was stopped, the wheels were cramped around to the extreme left and a padlock applied around the wheel spindle arm and through the eye-bolt.



With such an arrangement "Jim" might run the car for miles, in a circle, but distance doesn't count in such a case, for if one were to notice a joy-rider driving a car in a circle for half an hour or so, one might be apt to ask a few questions.

Digitized by Google

One of the best devices that I know, which seems to be fairly thief-proof, is arranged to be applied between the carburetor and the intake manifold. It operates an auxiliary butterfly valve in such a way as to cut off the mixture when the car is not in use.

If the reader does not care to purchase such a device,

he can accomplish the same results by locking the gas and spark levers to the steering wheel as shown in figure 3 at C. If he is mechanically inclined, he can easily disconnect the throttle linkage near the carburetor and apply a padlock to that point in such a way as to shut off the butterfly valve entirely.

In figure 3 at D is shown a novel, though not very practical device. It simply annoys the thief for a few short moments, and is effectual only if the car is not equipped with a hand starting crank. The device is nothing but two wood or iron blocks locked around the starting pedal. There are many devices which can be applied in the gasoline line between the carburetor and the tank, but they do not work satisfactorily, simply because the thief can rig up an auxiliary tank to hold a quart or so of gasoline within a very few minutes.

Now I have done my duty—I have warned you against the thief, I have shown you how to annoy him and how to protect your car to a certain extent. So if your little machine should wander away from its cosy home and its kind parent, don't try to blame me, I just won't stand for it, that's all there is to it. I don't want you to send me a letter like the following either, I wash my hands of all responsibility.

Dere Sir:

All them things you told me about to do for thieves I did; but it makes no difference. Yesterday I left my car out in front of my shop and a steam roller came along and squashed it flat. I can't find the car at all, nothin' but some pieces of iron and leather. What can I do to stop this happening in the future as I don't want to take no more chances? Steam rollers don't pay no respekt to a locked car like thieves do.

Hi Jinks.

The Spring Window Display

If the Beholder Catches the "Spring Fever" From Your Show Window, He Will Surely Purchase Auto Accessories

BY FRANKLIN MYERS

WHEN you consider that the store window is space that you pay for in cold cash every time you pay your rent, it is really worth while going to some extra trouble, if you wish to call it that, to fix up so that it will be attractive enough to bring in customers. Nowadays the public has become so used to seeing good window displays and good show cards that unless the retail accessory dealer keeps up with his fellows, he is liable to be distanced in the race.

Make the Show Window Pay Its Way

There is no good reason why the average accessory store on the average avenue should not get down to real business methods and make the show window pay its way. There is an inexcusable lack of interest hanging around loose somewhere in the store carying what sign men call a dead window—and the business done is generally proportionate to this same lack of interest.

Can anyone tell me how, where and why the accessory dealer ever got the idea that he couldn't use decorative displays in his windows the same as a druggist, a department store or a sporting goods house? Imagine what these folks think of their windows—let a little light permeate that solid ivory dome—get wise to the fact that as an auto accessory dealer you have been already distanced in the race so far as attractive windows are concerned. I don't mean to be discourteous—but a brickbat will wake a real man up quicker than a bouquet!

The estimated value of the window in the great New York stores contains big figures. Macy's windows are said to be worth $100,000 a year, or one-fifth as much as the expenditure for newspaper advertising. A Fifth Avenue shop, near Thirty-fourth Street, values its six windows at $40,000 a year. The Wanamaker, Philadelphia, store justly values its windows at not less than $75,000 a year.

Lord & Taylor's window in New York is made so that it will descend bodily to the floor below, where it is dressed and then raised to the street level by means of machinery. One of these large window displays can be assembled and put in shape for the public view in a few minutes, a small army of men being ready to make the change below.

These few facts are mentioned that you may get some idea as to how show window values have grown in the last twenty-five years.

It pays to take the extra time to arrange good window displays—the man in trade who treats his business

Digitized by Google

as a pet hobby has the advantage every time because his heart is in the work and it's bound to tell.

Every window display is the store's smile. This smile will show out through the store window and into the hearts of other folks. People patronize the merchant who exhibits a keen interest in his own business. He exhibits his interest in the form of clean choice pictorial show cards, or posters, or clever window displays and that interest is catching.

Folks figure that a man so fond of his business must be the man who naturally would study the interests and welfare of his customers—and they find that this is so—it is the truth and truth is mighty. It compels us often to live whether we will or no—it makes us be square with ourselves and our neighbors—it compels us to go to our work gladly and happily—it compels us to clean up—brush up—to look nice and to want nice things.

Stores Known by Their Windows.

Men are known by the company they keep—stores are known by the windows they keep. This is just as sure as anything can be.

Get busy with your store window, Mr. Retailer—don't hang fire and wait around to see what the other fellow is going to do with his. You may have an advantage over him anyway by being handy with brush and pencil.

Who cares a rap for the store with dirty windows and an exhibit of goods that look like a mess of scrambled eggs—who cares for the merchant who has a store with "We don't care" written all over it?

The store window is the greatest local advertising medium the accessory dealer has—and any concern that does not advertise to the full capacity of this medium impresses the public as merely an experiment. The fact that your shop or store may have been in existence for many years does not help it so very much in these times. The public may look at mere existence for a long term of years as a disqualification, indicating preference for old-time methods.

This Cardboard and Paper Cut-out Is to be Reinforced by Wood Strips Glued on the Back of the Branches—Suspend in Window on Three Wires Securely Fastened in Screweyes at the Top.

Digitized by Google

One store man said to me the other day that he had "never been educated up to it"—meaning, of course, good window displays.

Education is not confined to the ultimate possession of the much-coveted high school parchment or diploma and feeling in that piece of evidence lies our claim to culture. (Not the German brand.) Education is a matter of learning every day, and as we go. It is a matter of imbibing knowledge every day, of learning by each hour's experience, of adjusting ourselves to circumstances as they rise and of growing to meet the needs of a growing work.

There is no more comparison possible between the work of the display manager of the present day and the old-time window dresser than there is between the ways of doing business that are used by the big department stores and the cross-roads merchant. Pretty nearly everything in the work has been changed in one way or another, and I think that everybody will admit that the change has been very much for the better. Window displays are now as essentially valuable from an advertising standpoint as publicity in the press.

I am fully satisfied that I can venture this one point—that if the auto accessory dealer does not pay more attention to these special window attractions he will see

the day when the department stores will take over his business—or at last make big inroads into it.

I am not talking about how you place your goods in the window—anyone can do that—I am talking about timely attractions that bring the crowds—for instance:

Special selling booths are becoming popular for all special occasions—and spring is a special occasion if you please—if you will but make it so. I have created a spring selling booth that can be built at very moderate cost, a sketch of which is shown herewith, and if you have a bundle of enthusiasm lying around loose, or lying dormant, get at it. Bring it out of its hiding place, and enthuse over one of the most beautiful attractions possible.

The entire frame work of this booth is built of wood scantlings and strips braced at proper points. Any good sign man or handy clerk will know what is wanted if shown this sketch. The booth can be made square or long shape, as here shown. The bottom part is enclosed with unbleached muslin, painted green. The counters of course are of ordinary boards covered with light green crepe paper. There are four posts to hold up the top of booth, and criss cross lattice-work on top as a roof, to which all card board pieces are to be tacked.

The tree trunks and limbs are cut out of old card board boxes and glued together. You do not have to be particular with this part of the work, for over the three trunks and limbs must be wrapped gray crepe paper to give the appearance of regular trees. The card board tree trunks you will notice go around either side of the upright posts at each of four corners.

At the top you will notive a broad gray band—that is sky blue card board—a band of it all around the booth and is put there to give a suggestion of blue sky. Cut out odd zigzag pieces of white card stock, large size, and touch on with a one-inch brush spotty dashes of medium pink aniline color to represent a blossom background.

You will probably need thirty or forty of these pieces and they must be tacked on the lattice work at the top—

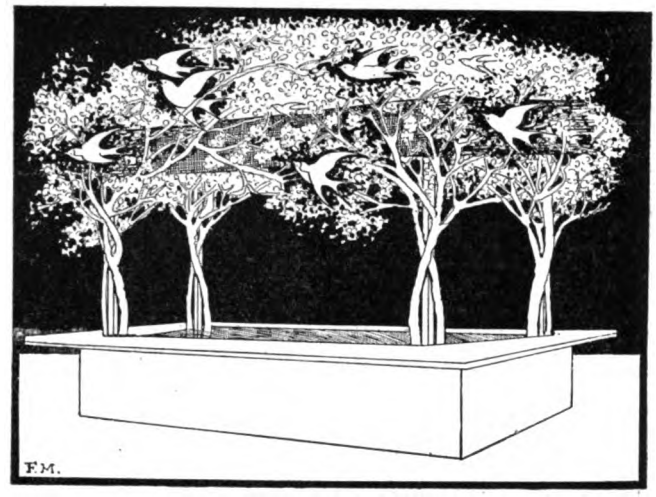
Digitized by Google

the largest pieces in the centre, and graduating at sides and ends. But before tacking on these pieces it is advisable to stick on to the white cardboard pieces numerous cut-out blossoms. There is a glazed paper on the market which comes in tints and colors.

You will need about 10 sheets of light pink, 10 sheets of white, 10 sheets of light green and 10 sheets of strong pink. Cut the paper up into squares of three inches. Take four or five pieces at a time: fold them twice into a smaller square. Take the scissors and cut a half circle around the open edge of paper, and then separate the pieces.

In this manner you will be able to obtain good "live" blossoms to be touched on (with glue) to the cardboard pieces before tacking them up. Hide the sharp edges of the cardboard pieces by glueing blossoms to those exposed parts. The whole top of the booth can be built, blossoms, branches and all, before putting up, if so desired; in fact it is the convenient way to operate.

The tree trunks and lower branches can be adjusted to the booth after the top piece is put on and the blue sky band is in place.



The birds are to be cut from yellow and red cardboard and attached to booth by wire so as to keep them from looking as if they were glued on.

Some store and window cards are shown in this article.

I believe in cards that carry an idea that will impress a fact—such cards are remembered—it is advertising that is never lost—but really cumulative. Folks will return after many days and ask for some certain article through the fact of having carried with them a certain Idea picture that compelled their notice to the point of remembrance—that is the mission of the Pictorial Window Card.

The text of a card is sure to be read if the eye is attracted first by a striking illustration done boldly in black and white—this is the key note—a weakly drawn picture does not carry a forceable impress to the mind and is fit only for the waste basket.

Spring Selling Booth.

Sales clerks who desire to make their own pictorial cards may do so by making use of the able little pantagraph for enlarging small pictures to regular card size. Full directions come with each instrument.

BE CAREFUL.

Gasoline is good for cleaning gloves and garments of all kinds and with so many cars in use gasoline is very accessible. Lots of people use it with no thought of the danger they run in so doing. A writer in the New York Tribune in considering the matter of fires has this to say:

"Don't try to save 10 cents by cleaning your gloves with gasoline, naphtha or other cleaning fluid and burn your house down in the process. Many women do and disfigure themselves for life in the bargain. The annual prey in this country of home cleaned garments is 3,000 homes burned and over 500 women burned to death, besides twice that number so injured that they carry ugly scars. Is it worth while? If you must use cleaning fluids at least do so out of doors, and keep them stored in a metal box outside the house. Fire caused in this way should be covered with sand or soda."

It is to be hoped that every reader of the Automobile Dealer and Repairer will caution his women folks or have them read this article. It may save much suffering perhaps and a number of lives.

When Does Welding Pay?

BY DONALD A. HAMPSON

THE automobilist who is confronted with a broken part from his car—a part that is expensive to replace or that involves more or less delay in getting a new piece—straightway thinks of having the broken part welded. The marvelous things he has read about and the good "fixes" he has seen quite naturally have built up the impression that welding is the panacea for breaks.

And the garage man who has a welding outfit in his equipment is alert for chances to make use of it; he may be perfectly sincere in his recommendations but may make mistakes in trying to weld anything and everything, simply because he has not a broad knowledge of the materials of construction. A few words of warning and suggestion as to when not to weld will follow.

The best welder the writer ever knew turned down more jobs than he accepted. He was conscientious and had a thorough knowledge of metal working, he temporarily offended some customers by refusing to weld parts on which they were "willing to take the risk" but these same customers became his strongest boosters after they had had the work done elsewhere and it had proven too weak for automobile stresses.

"Welding is the greatest aid the repair business has ever known," he would say, "but to be successful you have got to learn to say 'no' when you run up against jobs that wont be lasting ones, and your machinist's experience must tell you which they are."

To Weld or Not to Weld That Is a Question.

* * *

Whether it is better to turn away a dollar's profit, or be honest and thereby save your reputation for turning out a job that lasts as long as the machine itself.

All common metals can be welded. It is the element of heat which works the havoc with automobile parts—the heat of welding is so great that it softens and hardens parts on the one hand and it warps castings having accurately machined surfaces on the other hand.

Thus in the first case, the part (which may be a gear) will have a soft section of decreased strength and poor wearing surface, in the second case, a crank case, for example, may be so badly warped that the cylinder face will require re-planing and the bearings all need to be fitted anew. Ordinary common sense demands a survey of these to-be-expected conditions before the welding is authorized—then a very little figuring will show wherein lies true economy.

Cylinders and crank cases *are* welded without any warping or other harmful effects but in the main, such jobs are the work of specialists who have unusual facilities and are thus able to counteract the ill effects of welding heats—a parallel case is that of the great hospital which can make a success of a difficult operation that would be folly to attempt in the office of a country doctor.

Unusually skillful men can sometimes accomplish the near-impossible; I recently saw an Overland rear axle shaft that had broken off clean at the square while the owner was on a trip, had been welded by the owner as a chance on getting home, and had run 1200 miles before breaking in the weld—but this man admitted it was only luck and that he would not think of doing such a thing for a customer.

Case hardening, spring temper, oil temper, toughening—these are names that cover various forms of heat treatment applied to steel parts to bring out a maximum of strength or wear, that maximum being required in automobile service. A weld in any such parts is a waste of good money and an invitation to further trouble, possibly disaster. Any heat over 500° will soften the parts and nullify to greater or less extent the benefits of original treatment. The welding heat is several thousand degrees, and this necessarily spreads a short distance each side of any break.

Aside from the softening of adjacent portions, the material of the weld itself is not the same as the rest, usually not nearly as good. Some misguided individuals build up gear teeth by welding on—as well resort to the common repair on light machinery of putting in a couple of pins in place of a tooth.

And we even see spring leaves welded! There is only one way to properly repair a break in such a heat treated part—that is, to use a welding material of the exact same composition as the original piece, to make a weld which is perfect clear through and as strong as an unbroken part, and then to give the entire piece the identical heat treatment that it received at the factory in the beginning—and it is impossible to satisfy all these conditions in more than one case out of a thousand.

Welding *can* be of great practical value in the automobile repair business. Specialists and honest, skillful men can do wonderful things with major parts, and unimportant parts can be welded successfully by beginners.

But the dabbler, who has added welding to his box of tricks that included everything from car washing to electrical repairs, "welds" by sticking on gobs of metal producing a job that may look secure and may carry around the block, but is useless for a permanent repair as so much solder dropped on in the same way.

The Care and Repair of Tires

Part 2.—How to Keep Tires in Condition, the Importance of Proper Inflation and Storage.

Copyright, W. E. FABER*

POSSIBLY the fact that tire makers have placed guarantees of from 3,500 to 5,000 miles on their product has led the average car owner into the mistaken belief that the guaranteed mileage is about all he has a right to expect and that any service he receives in excess of this guaranteed mileage is due either to exceptional tire quality or exceptional good luck.

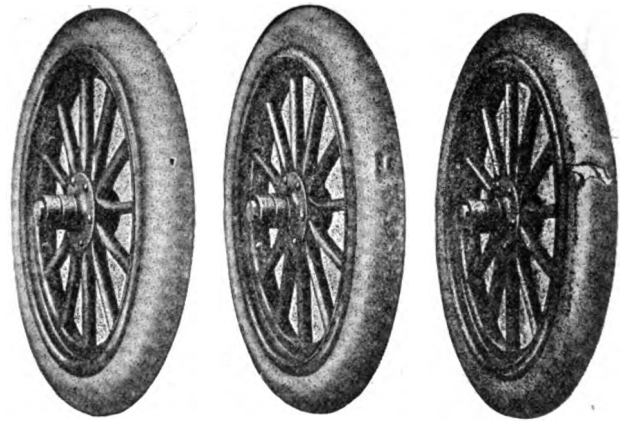
While that may be an optimistic way of looking at the situation, it should be remembered that no matter what mileage may have been secured from a tire that has been allowed to go without attention or care until its life has ended, there is no doubt that the observance of a few simple precautions, easily within the ability of anyone, would have added hugely to that mileage. It has been well established that a reasonable amount of attention will invariably be repaid in the mileage that can be obtained from any good tire.

As an illustration, the writer recently had occasion to correspond with a number of motorists to whom a certain tire manufacturer had awarded prizes for securing exceptional mileage. All of these people had driven twenty thousand miles or more on the tires that were under observation. Some almost reached the twenty-five thousand mark. Without exception, while they admitted that the quality of the tires had had something to do with the result, they agreed that the care the tires had received was a highly important factor.

Another case that has been authenticated is of a tire that has given more than thirty-eight thousand miles and when last heard of was still in active service. In this case, too, the care that had been given was considered largely responsible.

The life of a tire should be over ten thousand miles under ordinary usage and conditions; but it is safe to say that two-thirds of the tires used are thrown in the junk heap before they have gone more than half that distance.

In this section, therefore, we shall take up in detail some of the methods that motorists have found effective in obtaining the higher figure.



Proper Inflation.

The importance of proper inflation certainly entitles it to consideration as the first of the factors entering into the securing of the mileage that is built into a tire. Most people do not realize the damage that underinflation will surely cause. The novice is sometimes afraid of inflating his tires too tightly, something that cannot be done with a hand pump and is seldom done with a power pump.

Nothing will wear out a casing so quickly as running it with too low an air pressure. The fabric is bent and twisted so much that the threads cut each other, the rubber is disintegrated, and the tire wears out like an old leather hinge. The layers of fabric become separated—a good bump bends the casing so much that the inside layers break—the tube works itself into the crack—and then comes one of those inexplicable blowouts, often in a new tire, that makes the tire adjuster want to change places with the recording angel.

Roughly speaking, a tire is properly inflated when it will stand up full and round under the weight of the loaded car A kick at the tire tells you nothing. A tire gauge is the only sure way of knowing anything about the pressure.

Tire makers indicate on their tires the correct pressure to be maintained, and their instructions should be rigidly followed. The general rule is twenty pounds of pressure for each inch of cross section. That is for a

Three Stages of Tire Disintegration: A Small Cut Appears in the Tread; At the End of 500 Miles a Sand Blister Forms, and in 500 Miles More the Tire Blows Out.

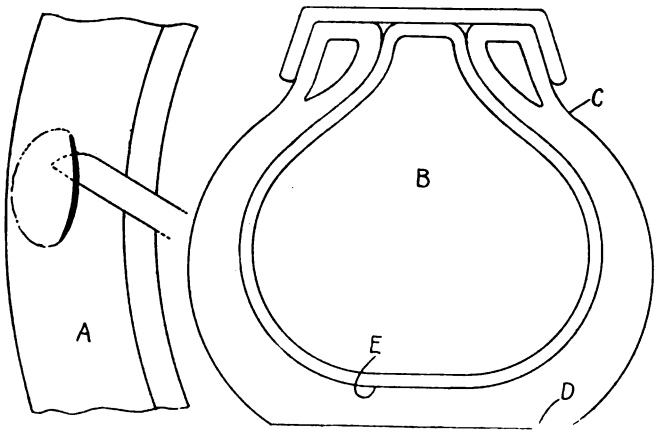
3½ inch tire the pressure should be from 65 to 70 pounds if the tire is carrying the normal load for which it is designed.

If exceptionally heavy loads are to be carried the pressure should be increased correspondingly. Especially during the first ten days a tire is in use it should be attended to daily, for the casing stretches more or less and the pressure is thus reduced. After this period, unless the tire shows symptoms of a leaky valve or other leak, an inspection once a week will be sufficient.

There is a popular impression that the pressure in a tire should be reduced during hot weather. This is absolutely wrong. Really more care should be taken to keep the tire up to full pressure in the summer than when the weather is cool. A loosely inflated tire is subjected to so much extra bending as it passes over the

Digitized by Google

road that it actually heats more than if it were pumped up to the standard pressure.



It is the heat that injures the tire by causing the rubber to lose its adhesiveness so that the fabric separates. In addition there is the danger of rimcutting, bent rims and other damage. The expansion of the air in the tire due to the heat of the atmosphere will only increase the pressure a few per cent so that there is no danger of a blowout from that cause.

One should never drive on a flat tire, even for a few rods, because there is the certainty of damaging both casing and tube, and the likelihood of skidding or loss of control. The safest way to do if caught without a spare casing is to remove casing and drive on the rim. Don't remove the rim or you are liable to have the whole wheel fall to pieces.

Remember then, as the first and most important rule for tire conservation, to keep your tires pumped full all the time.

Care During Storage.

Most motorists know that continued exposure to direct sunlight will harden and crack the varnish on their cars, but they do not always realize that the rubber in the

A, Opening a Sand Blister to Let Out the Dirt; B, Result of Underinflation; C, Tire Bends Excessively at This Point, Causing Rim Cuts; D, Large Ground Contact Means More Punctures; E, A Bump on the Road Will Bend and Break Fabric.

tires is the same sort of a vegetable product and that light has the same effect on a tire. Park your car in the shade when possible, and when it is in the garage keep the garage dark.

When a car is used only at infrequent intervals, it is a good idea to jack up the wheels and partially deflate the tires. This is done, not so much to take the imaginary strain from the weight of the car off the tires, as to prevent the weight of the car from settling down on a tire that may have a slow leak, and pinching the tube and casing. If a tire is fully inflated the pressure per square inch on the inside of it is very little different whether the car stands on the tire or is supported on jacks.

Keep in mind that conditions which will rust iron will rot a tire that has its fabric exposed either by cuts through the tread or by exposure of the inside of the tire when stored off the wheel. Moisture has no effect on the rubber, but it is ruination to the cotton fabric.

In winter it is best to remove the tires from the wheels and after being sure that they are perfectly free from oil, water, etc., wrap them with cloth and paper to keep out the light, and store them in a place where it is cool and dry. If the car is set on jacks the tires may be partially deflated and wrapped as they are on the wheels.

If the tires are taken off the wheels leave the tubes in the casings and put in enough air to keep them round. Do not hang the tires on a nail or hook as that will cause them to take an unnatural strain that may deform them badly. It is much better for the tires if you will simply pile them on the floor.

Why Wheels Must Run Parallel.

Unless the wheels are parallel the tires are shoved along the road instead of rolling in a straight line and the result is about the same as if they were pushed over a big piece of sandpaper. The treads are worn rapidly so that if a tire shows signs of undue wear in the center of the tread examine your wheels and straighten them out or have it done immediately.

A loose steering gear that lets the front wheels wobble has much the same effect. Above all things the front wheels should not "gather" or "toe out." It is better to have them "toe" in so that the front edges of the rims are half an inch nearer together than the rear. This offsets the effect of the slant that is caused by the slight deviation of the steering knuckles from the perpendicular and makes steering easier without harming the tires.

Substances That Destroy Rubber.

Light and heat, as explained before, have the effect of overcuring the rubber and hardening it. Water, when admitted to the fabric, rots it and causes it to loosen from the fabric. To a large extent it is impossible to protect a tire from these, but there is another enemy that causes more trouble than all of the others. That is oil.

Oils of various kinds are ready solvents of rubber and will rot a tire quicker than any other substance. Consequently the garage floor should always be kept clean and dry and if in oiling the car or as a result of leaky bearings oil is spilled on the tires it should be cleaned off immediately. Use soap and water, not gasoline.

What Rusty Rims Will Do.

Iron rust eats into canvas very quickly and for this reason the rims should be examined and cleaned a few times each season. Assuming that the rim is clean, as it should be when the tire is attached, it may be kept so indefinitely if proper attention is given to keep the rims straight and if the locking nut on the valve stem is drawn tight so that no water can work in through the hole in the rim.

If on inspection the rim is found to be rusty, even though merely in small spots, the rust should be sandpapered off and the rim given a coat of thin shellac. Ordinarily stove polish, which contains graphite, is also excellent for preventing rust and making it easy to remove a tire in case of an emergency.

Digitized by Google

Any dent or bend in a rim should be corrected as soon as discovered, for if the bend is inward a great strain is brought on the bend and side of the casing. If the bend happens to be outward there is a fine chance for water, oil and dirt to work in between tire and rim.

The driver who likes to show how quick a start he can make, or who puts unnecessary strain on his tires by starting with the high gear engaged is usually the fellow who wonders why his tires don't give him the service that some of his more conservative neighbors receive. He forgets that the entire energy required to set a mass of a ton or two in motion is all concentrated into one huge kick applied at one small point on the rear tires. Start on low. That's what your gears are for. Take curves and corners at a moderate pace for safety as well as for economy.

On wet or frozen roads skidding is practically unavoidable unless chains are used. The chains must be adjusted loosely enough so that they can travel around the tire, otherwise they will gouge the treads and tear them loose. Take off the chains as soon as the necessity for their use has passed. On a soft road the chains sink into the ground and do not hurt the tires but when you get on a hard road it is another story.

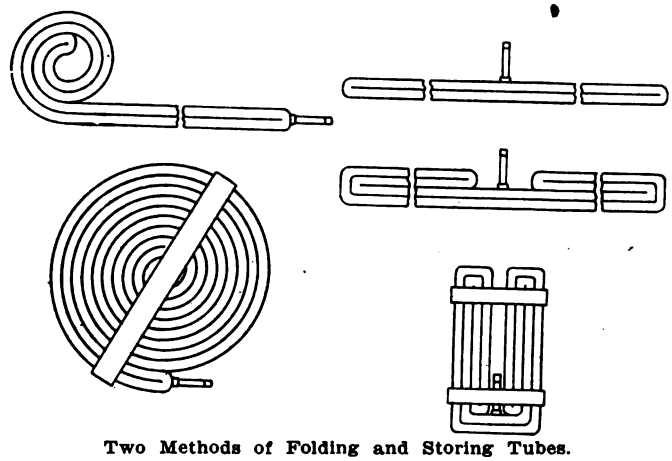
Winter driving is usually wet weather driving, and consequently the treads should be watched even more carefully than in dry weather for the appearance of cuts that may let water get to the fabric. Even the small holes due to punctures ought to be fixed right away. It will be economy to pay the repairman for doing the work if you do not have one of those small, inexpensive vulcanizers that are so easy to use for this purpose without even taking the tire off the wheel or letting the air out.

At all times endeavor to keep out of ruts. It is better for your tires and for the rest of the car, too, to drive on the rough part of the road than to have the sides of the ruts grinding away at the sides of the tires and throwing the car from side to side.

Street car tracks are even worse than ruts. Keep away from them. The tire is distorted and bent as it runs along the rail groove, and on curves and crossings especially there is almost always a knife-like fin sticking up to cut the tread all the way around. This cutting is exceedingly likely to occur in wet weather.

Don't apply the brakes suddenly enough to lock the wheels and drag the tires. Your car will come to a stop sooner if you tighten the brake to the point where the wheels just barely revolve, and your tires will not suffer. Remember that it is the friction of the tires on the road as well as the grip of your brake-bands that stops the car, so don't try to stop all at once. Plan to coast to your stopping point and use the brakes as little as possible. Be sure that your brakes are working equally, or one tire is going to do more than its share of the work and will suffer accordingly.

Application of Tires.



First be sure that the rim is clean. Examine the inside of the casing to see that there are no particles of dirt, or possibly the nail that caused the puncture, remaining to damage the tube. Put into the casing enough soapstone or graphite to cover the inside well and prevent the tube from adhering to it even after long service. Be careful not to use too much soapstone as the excess is likely to collect in one spot, harden and hurt the tube.

Before placing the casing on the rim inflate the tube until it is round and run your hand around inside to be sure that it isn't twisted or wrinkled. If your tire is equipped with a flap be careful to have the flap free from wrinkles or kinks. Never insert a tube in a casing that is damp, and never put in a tube that is still damp from testing for a puncture.

It is generally accepted that the use of an inside liner will prolong the mileage of an old casing. However, they should not be used in new tires as they stiffen the tire, taking from its resilience, and by adding to the thickness of the fabric tend to generate heat.

The experience of the tire manufacturer has taught him how thick a casing should be in order to give the best possible service. The same statement applies to outer casings adapted to be used over a standard tire, and to the practice of sewing or cementing two tires together.

In the manufacture of tires the strength and durability of the tread is carefully balanced with the resistance of

Two Methods of Folding and Storing Tubes.

the fabric to the strains it must withstand. The retreading of an old tire is always of doubtful value as the chances are that the fabric has had its day and will not last long enough for the owner to get the full value out of the new tread.

Retreading is apparently a real economy in the case of a comparatively new tire that has had its tread destroyed by some untimely accident such as tight chains, misaligned wheels, careless braking, etc., providing the fabric has not been exposed to moisture enough to cause deterioration. Cord tires, owing to their construction, which largely eliminates wear of the fabric due to bending, will usually outwear the original tread sufficiently to make retreading very profitable to the owner.

Care of Spare Casings.

Needless to say, the spare tire should be protected from light, water and air by the use of a first-class tire cover.

Digitized by Google

If the tire is carried inflated, it should not carry more than half the pressure that it would carry when on the wheel. This may be a little bit inconvenient, but it is better than having a new tire go wrong within a few miles after it is put in use. Many motorists put the new casing on the wheel at once and carry an old one for a spare, believing that this practice reduces the chance of trouble on the road as well as prevents the new tire from having a chance to deteriorate before it is ever used.

If a spare tire is carried otherwise than inflated on the rim, keep water out of it. Examine it after washing the car or driving in the rain, and if it is wet inside wipe it dry.

Care of Spare Tubes.

From three to six extra inner tubes used to be considered as an indispensable part of every car owner's equipment. Punctures were unavoidable and it was practically impossible to make reliable repairs on the road.

Now, however, a great many thousands of people have replaced their stock of tubes with one of the little vulcanizing outfits that carries the rubber patch and a chemical heat unit in one convenient cartridge all ready to put on the tube and vulcanize a permanent repair at any time. It is just as easy and quick to take out a tube, vulcanize it, and replace it as it is to change tubes. Not only is the investment in tubes saved, but a repair bill is eliminated.

The motorist who carries tubes is usually forced to carry them in the toolbox with other articles, which unless protection is given, are likely to ruin a tube before it is ever put into a casing. The jack and the pump and the oil can all do their bit and their job of destruction is made easier by the heat from the engine.

The spare tube should be carefully folded to prevent chafing and carried in a bag that has been well dusted with soapstone. Put it in the coolest corner of the toolbox, away from the exhaust pipe. Pack it in so it can't rattle around.

We illustrate two excellent methods of folding tubes so that they will suffer the least. In both methods it is necessary to take out the valve-inside and let all the air out of the tube while folding, then put the valve back together to keep the air out. Don't tie tubes with a string. Use a wide strip of cloth or some rubber bands half an inch wide, cut from an old piece of tube.

The strength of a tire is in the fabric. The tread is only a covering to keep destructive substances away from the fabric. As soon as a stone cuts through the rubber the weight of the car begins to drive dirt into the cut. The dirt is forced between tread and fabric and usually the first symptom of trouble is a sand blister that may appear several inches from the cut where the dirt entered.

Of course water gets in, too, and as it has no chance to escape it starts a decay in the fabric that almost invariably causes a blowout sooner or later and then both tube and casing are ruined.

Here is an opportunity to take the stitch in time that is so much easier than the nine that must be taken if the first is postponed. At regular intervals, and especially after long trips the casings should be examined carefully for little cuts that penetrate to the fabric. Take your vulcanizer and seal these cuts before the germs of tire trouble begin to infect them. It means the difference between wearing out your tires and having them blow out.

It's like cleaning your teeth to save trips to the dentist, you know. And it isn't much more difficult than cleaning your teeth, either, for it isn't necessary to take the tire off the wheel or let the air out of it.

When on a trip or if it is inconvenient to make permanent repairs for some other reason, use one of the prepared patching gums for a temporary filling until you can get around to use your vulcanizer.

In case a sandpocket appears a good way to arrest the progress of it until you can make a repair is to cut through the tread half way around the blister on the side of the tire so that the dirt can get out as fast as it comes in instead of being crowded in further between rubber and fabric all the time.

Second in importance only to proper inflation is the care of small tread cuts and sand blisters. With an open cut in the tire, a few hundred miles is enough to cause a destructive blowout—and blowouts are expensive. It has been said that the last mile in a tire is the cheapest and unless one takes prompt care of the little cuts he can be mighty sure that he will never get *any* cheap miles.

The information we have given is based largely on the advice of tire manufacturers who have given it willingly in order that users of their product may secure all of the mileage that is built into their tires—and after all mileage is what we really buy when we buy a tire.

*Note.—Mr. W. E. Faber is the Advertising Manager of the C. A. Shaler Company.

(*To be continued.*)

CLEANING CELLULOID WINDOWS.

We have in this office a number of letters from subscribers who wish to know how scratches and marks can be removed from celluloid windows in automobile curtains and will answer them all in one article.

Celluloid is a soft material and after constant use its surface is covered with hair scratches which tend to render the material translucent or cloudy. There is no practical method for removing these scratches, nor is there any need for so doing.

The reason for the whiteness of the celluloid is that each scratch refracts the light which passes through the material at an angle and so clearness can be had by filling the scratches.

A rule which often works on many grades of celluloid is as follows: With a fine brush apply a thin coat of ether to the surface and let it dry in the air. Only fine hair scratches will yield to this treatment, but the resulting surface is practically as good as new.

If the scratches are heavy they can be filled in many cases by the application of a thin coat of white shellac or varnish.

Differentials and Universal Joints

The Engine May Be Important, But It Is Useless Unless the Transmission System Is in Order.

BY F. L. ALLEN

PRACTICALLY every one who has never thought the matter over, has an idea that the most important part of an automobile is the engine, and to a certain extent this is true, but there are many things between the engine and the rear axle. As far as we have

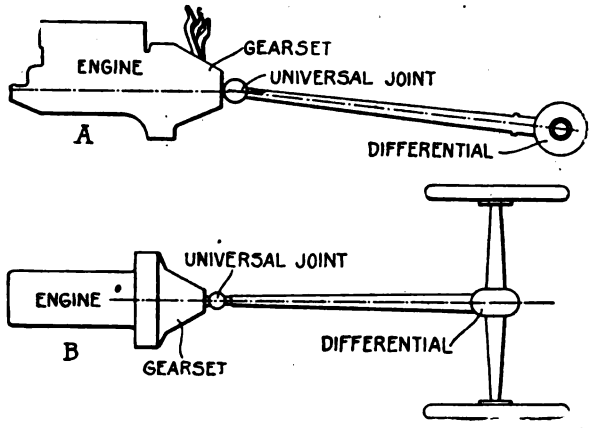

Fig. 1—Sketch Showing Change in Direction of Power Transmission from Engine to Wheels.

gone, power has been transmitted from the engine through the clutch and the gear-set, and if this unit is attached to the engine or located amidships, as far as we are concerned, the power has been transmitted in a straight line.

The power plant, consisting of the engine, the clutch and the gear-set, is usually located high upon the frame of the car, and is never in line with the center of the rear axle. Therefore, we must adopt some means whereby we can alter the direction of the power from a line parallel with the ground as shown in figure 1 at A, to the center of the rear axle.

The connecting shaft or the connecting link between the transmission gear-set and the rear axle is usually termed the propeller shaft, and as there is a sharp bend in the power line at the rear of the gear-set at that point, some sort of a double hinge must be provided. This device is termed, in automobile vernacular, as a universal joint. It is really as we have described it—a double hinge. There are many forms of universal joints.

In figure 2 are shown two types of universal joints. The second, at B, is known as the cross and ring type, and is very simple in construction. It consists of two Y-shaped members—one of which fastens directly to the gear-set shaft—the other to the propeller shaft. These are placed with the tops of the Y's together, and the points of the Y's 90 degrees apart. The points of the Y's are held in place by a ring usually made in halves, either riveted or bolted together.

The type of joint shown at A is even more simple than that shown at B. In this case the ring is left out, and the Y-shaped members fit directly upon the cross, which is termed the spider. As a general rule, joints of this type are fitted with bronze bushings, so that in case of wear they may be repaired very easily without taking the joint from the car.

In figures 3 and 4 are shown two more types of universals. The one shown in figure 3 is nothing more or less than a slide in which a T-shaped member is fitted. The casting, which is circular in form, is bolted to the driving shaft of the gear-set and entirely surrounds the joint. Across the diameter of this casting are cut two grooves, and into these grooves is fitted a T-shaped forging which connects directly to the propeller shaft. Both studs at the top of the T are fitted with small round balls so that this joint may be repaired rather than be removed in case of wear.

A joint illustrated in figure 4 is very popular among the car manufacturers. It is a combination of a number of types, and is simple in construction but very efficient. There are three parts to it—the circular member is bolted to the transmission shaft, the cross fits into it at two points and leaves the other two points upon which are mounted the Y-shaped member which attaches to the propeller shaft. These universal joints may be found at any point where there is a change in the direction of power transmission.

One or More Universals.

In many cases where gear-sets are located amidships, that is, separate from the engine, one or more universal joints may be interposed between the engine and the gear-

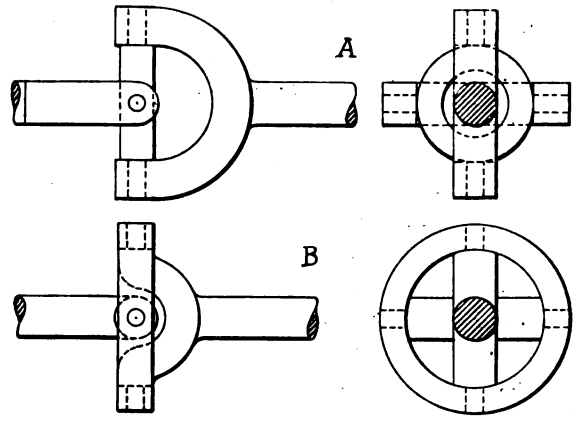

Fig. 2—Two Types of Universal Joints.

set. Between the gear-set and the rear axle may be found one or two universal joints. If there are two, one is placed at the rear of the gear-set, while the other is placed at the opposite end of the propeller shaft where it is connected to the pinion gear in the differential.

Digitized by Google

One should realize that the universal joint carries all of the power from the engine: It is a moving member, and each hinge moves back and forth at every revolution of the shaft. Consequently, it requires a great deal of lubrication. It cannot be left open because it will soon collect dust and grit and be destroyed.

There are two general methods of protecting the joint from dirt. The first is to enclose it with a boot of leather, while the second is to build round it a thin sheet-iron housing. This boot or case must be kept oil-tight, or the lubricant will leak from it. Therefore, in replacing the universal joint always be sure that the housing is tightly fitted in its place. Wherever there is a change in the line of power transmission, there is bound to be a certain amount of whip, as it is termed, unless the joints and bearings are absolutely tight. For this reason a worn universal joint or a joint that is not tightly fitted to the shaft will cause considerable racking of the car and engine.

Not only is there a change of direction in the power line downward, but in order to transfer the power to the wheels in the ordinary automobile there is a change

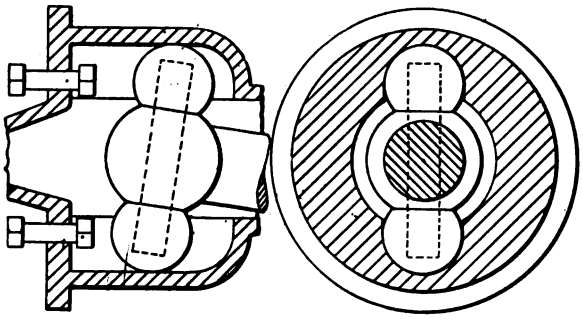

Fig. 3—Sliding Ball Type of Universal.

in the differential of the power at right angle, as shown in figure 1 at B. This change at right angles means that the rear axle is always subjected to a twisting motion in two directions.

First there is a tendency to twist the car over to one side, that is, to lift one wheel from the ground. The springs of the car take care of this tendency. The other tendency, however, is to twist the rear axle upward at the front and downward at the rear—just the reverse of the power required to twist the wheels and carry the car forward. For this reason some means must be adopted for anchoring the rear axle housing so that it will not strain the springs in a direction in which they cannot take up the shock properly. For this purpose rods called "torque rods" are used. Another term applied to these same rods is "radius rods." These rods are firmly fastened to the rear axle housing, and anchored as far forward on the car as practical. Since the change of power direction is at the universal joint directly behind the gear-set, the radius, or torque rods are fastened to the ball housing around the universal joint.

Not all cars, however, are fitted with such rods. In many cases, the propeller shaft is enclosed by a housing which swings upon the rear of the gear-set with the center of the universal joint as its center. This housing is designed heavy enough so as to take up this torque.

Reason for the Differential.

One seldom realizes how many problems are involved in constructing a rear axle and transmitting the power from the engine to the wheels. Aside from the problems which we have just mentioned, there is one more little natural law that means a great deal to the automobile manufacturer and costs a lot of money to overcome. This problem would be obviated if an automobile were always driven in a straight line. Unfortunately, however, all of our roads are not straight. Occasionally the automobilist finds it necessary to turn his car around, or to turn a corner. This means that the outside wheel on the corner must travel a greater distance than the one on the inside.

In turning entirely around, the outside wheel (assuming that both are 30 inches in diameter), must turn about two turns more than the inside wheel. Suppose that both of the wheels were fastened together, and forced to turn at the same number of revolutions. Then one of the wheels would be dragged and, sooner or later, the tires would be destroyed.

In addition to transferring the power to the wheels then, we must find some means of arranging the axle so that one wheel can run faster than the other if necessary. At the same time, however, we must so arrange the wheels that when the car is being driven straight ahead one wheel will not do all of the driving.

This is accomplished by means of what is termed a "differential;" a simple little device when one understands it, but a difficult thing to understand. In Figure 5 is illustrated the ordinary type of differential. At A is shown the driving pinion which is fastened directly to the propeller shaft from the gear-set. This pinion A meshes with the large driven gear, usually termed the "master gear," B. Now, B is not fastened directly to either of the axles which drive the wheels, but to the device termed the "differential." It is riveted or bolted to the differential housing E, therefore E rotates as long as the gears are in mesh and the pinion A is being driven.

Differential Gears.

Inside this differential housing are a number of gears, three, or in some cases four, one of which is shown at C, which are mounted upon the differential spider. This differential spider is firmly fastened to the differential housing, and of course rotates with the master gear B. These "differential pinions," as they are termed, shown at C, mesh with the differential gears D and there are two of these differential gears D, each of which is keyed to one of the driving axles attached to the wheels.

Suppose you were to lift one of the rear wheels from the ground. Let us assume that you lift the right wheel free, start the engine, and mesh the high speed gears in the gear-set. The pinion A starts to revolve imme-

Digitized by Google

diately, driving the master gear B which in turn carries around with it the differential housing E together with the differential spider. The differential gear at the left, which corresponds to D, being mounted upon the axle of the wheel which is held stationary, does not revolve, but since the housing E revolves, the pinion gear C rolls around upon the differential gear and this motion is transmitted to the gear D, therefore the free wheel revolves. The same thing would happen if you were to jack up the left wheel, except that, in this case, the differential gear D would remain stationary, and the differential pinion C would drive the left differential gear, and the left wheel would revolve.

Power Goes to Least Resistance.

In other words, power is transmitted to the wheel which is doing the least work. Now if both wheels are on the ground, the differential pinion C transmits the power equally to both differential gears, and the car moves forward in a straight line.

As another experiment, let us see what happens if we remove both rear wheels from the ground, and hold the pinion A stationary. We can do this by throwing in the high speed and engaging the clutch. The engine will then offer enough load so as to prevent the gear A from revolving. Then supposing we turn one of the wheels, the right one for instance, clock-wise. The differential gear D will revolve and necessarily turn the differential pinion C. This gear will drive the other differential gear which corresponds to D on the other axle, and the left wheel will revolve in the opposite direction.

The differential gears C and D only revolve while the car is turning a corner. On a straight road they are practically stationary. The whole housing E, however, revolves as long as the car is moving, therefore some means must be provided for carrying this housing and preventing friction. This is done by means of bearings

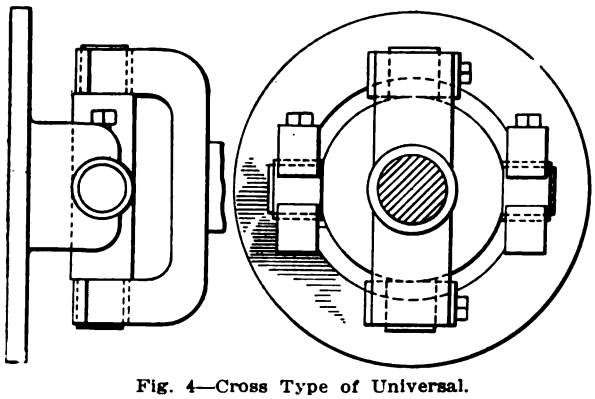

Fig. 4—Cross Type of Universal.

as shown at F. Another bearing is provided for the pinion drive gear at G.

Gears Must Be Properly Adjusted.

Every reader knows that two gears cannot run quietly unless they are properly meshed, and of course this same statement holds true regarding the driving pinion A and the master gear B. In practically all of the medium and high priced cars two sets of adjustments are provided. The first adjustment allows one to move the pinion A forward and backward, and so mesh it lightly or deeply with the master gear B.

The second series of adjustments are arranged so that B, the master gear, together with the whole differential unit, may be moved to the left or to the right, nearer,

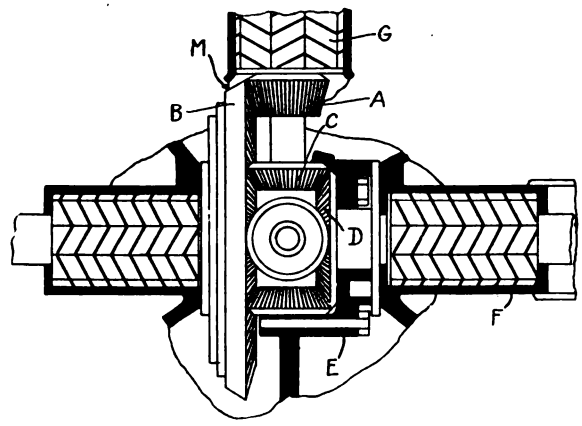

Fig. 5—Sketch Showing Differential Parts.

or farther away from A. The first is called the pinion gear adjustment, while the second is termed the differential adjustment. In making this adjustment, the pinion gear A must be moved towards the differential and the differential together with the master gear B moved towards the pinion until the teeth are tightly together, or "bottom," and the backs are in line as shown at M.

Line Up the Backs.

By rubbing the finger across this line, one can tell whether the backs of the teeth are correctly adjusted. If this adjustment were left in this position, the gears would grind, because they are meshed too deeply; therefore it is necessary that the pinion gear A be moved backward, but the relation of the two gears must be the same. If A is moved backward one sixty-fourth of an inch, B must be moved away from A a like distance. Therefore this is the next step in the adjustment.

Move A backward about one sixty-fourth of an inch, and B a like distance. Then fit a wooden handle to the pinion gear shaft, and turn A by hand. If the gears are still too tightly together, there will be a grinding noise and each of the gears must be moved backward a very slight amount until the grinding noise ceases.

If there is any backlash, or play in the gears, it is an indication that they are too far apart, and must be brought nearer together. If the teeth are so badly worn that backlash is had in any position, they must be replaced with new.

Under no conditions should the gears be left in the first position adjusted, that is, with the tops of the teeth of one against the bottom of the teeth of the other. This condition will result in the destruction of all of the bearings in the differential as well as the gears.

In cheaper cars, particularly in the Ford, no means is provided for the adjustment of these gears, and the only

Digitized by Google

way that the repairman can fix them properly, is to insert washers between the pinion A and the bearing, and between the differential housing and the bearings at each side until adjustment is correct.

There are two main types of axles in use upon automobiles, and they are grouped into two classes: "live" and "dead." Every reader is familiar with the dead type of axle, because it is just this type of axle that is used on every wagon or carriage built. The dead axle is fastened to the car and carries all of the weight. It does not revolve or drive the wheels. When used upon an automobile, the wheels are driven either by chains or by a set of gears. The axle itself does not revolve.

The live type of axle is divided into two main classes, floating and semi-floating, and different manufacturers make still further divisions. In the main, however, there are really only three classes of live axles, into one of which practically all live axles fall, and these types are illustrated in Figure 6. They are known as "semi-floating" as at A; "three-quarter floating," as at B; and "full floating," as at C; and one will notice that B differs very slightly from C.

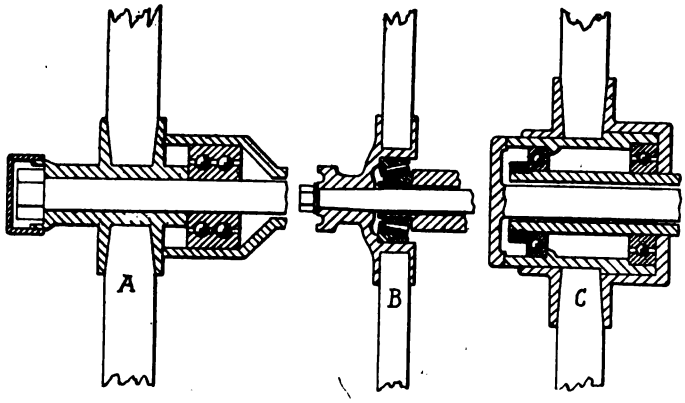

Fig. 6—Three Types of Axles. A, Semi-Floating; B, Three-Quarter Floating; C, Full Floating.

As a matter of fact, B and C may be considered in the same classification.

The Semi-Floating Axle.

In a semi-floating axle, the weight of the car, which rests upon the wheel, is entirely supported by the axle and its bearings, which are located inside of the rear axle housing. At A in Figure 6 is illustrated this type. The wheel is keyed to the axle, and the axle in this case rotates upon a set of double ball bearings. The outer race of this ball bearing assembly fits inside the housing, and of course supports the gear.

Conditions are reversed in the diagram C, showing the full-floating type. The rear axle housing extends inside the wheel and upon its circumference are mounted the bearings. Two ball bearings shown in the illustration serve to support the wheel. All of the weight of the car therefore is carried upon the housing itself.

The axle is used simply to drive the wheel and supports none of the weight. As a matter of fact, the weight of the axle itself is carried upon the wheels, since it is held by a driving flange to the wheel. In this full-floating type, one will notice that the wheel is supported upon both sides, two bearings being used.

(Editor's Note.)—The reader who is called upon to do any Ford or Chevrolet differential repair work should investigate the Bailey ball thrust bearings.

TRUTH IS OFTEN STRANGER THAN FICTION

A short time ago our editor, in looking through one of the New York papers, noticed an Associated Press report which read like a fable. The article was so unique that the editor sat down to his battered typewriter and pounded out the following poem.

One Hundred Per Cent American.

There once did live a Patriot true,
Whose name was J. C. Wagner.
He didn't shoot the kaiser up,
Nor hunt him with a dagger.
But he did have one son, did John,
A sturdy six foot Danny,
Who donned the khaki uniform,
And fought for Uncle Sammy.

* * *

Besides his son, old Johnnie had
A clock that said "Cuckoo."
And on its back, in letters bold,
"From germany to you."

* * *

When J. C.'s son had marched away,
That clock no more was heard;
The Cuckoo you will recollect,
Is hunland's national bird.

* * *

For thirty days and thirty nights,
Old John scarce shut his eyes;
His idea was, perhaps you know,
That clock to naturalize.

* * *

With saws and drills and bits of wire,
J. C. began to work,
He rigged a funny bellows up,
From last year's hard boiled shirt.
At last he rested from his toil,
His work is finished right;
The clock is running once again,
The bird now says "Bob White."

After having inserted the necessary (as well as unnecessary) periods, commas, stars and caps, he forwarded it to the subject, Mr. J. C. Wagner of Indiana, and shortly was rewarded with the following letter:

"Dear Sir:—

Your letter with poem enclosed has just been received. Yes, I am the J. C. Wagner that naturalized the cuckoo

Digitized by Google

clock to call Bob White. I reversed the bellows connection so that the high soprano whistle came after the alto. After reversing the whistle, a teaspoonful of sand poured into the soprano pipe or whistle raised the tone to the correct pitch.

If one teaspoonful is not enough to accomplish results, it is only necessary to give him or her more sand, until the right pitch is attained. It seems that a liberal dose of American sand is necessary to put the kibosh on kultur in a cuckoo clock; just as Yankee grit blocked german kultur at Chateau-Thierry. A battle in which my son took part, by the way.

In a later action, on October 10th, my son was wounded in action near Verdun; a piece of high explosive shell struck him above the ankle and fractured the shin bone. He is still in the hospital but we expect him home soon."

Though the subject does not pertain to automobiles we trust that our readers will be enough interested to pardon the digression, since the whole story and its sequel are so unique.

Winter and Wet Weather Driving

BY J. FRED GILMAN

Starting your engine on a cold morning.

The cooling system requires more care in winter than in the summer.

Saving gas by using the hand throttle.

A few words about chains and their application.

Other money-saving kinks.

WHEN you start your car these cold mornings, have you noticed that the self-starter whirs a longer time than it did in summer before the engine starts? The self-starter is designed to start the engine, and will, if the battery is in proper condition. But bear in mind that the current consumption is not by any means proportional to the time that the self-starter consumes to start the engine.

The greater viscosity of cold oil in winter will make the starting torque so great as to demand three or four times the amount of current from the battery than it did in summer. Therefore, assist the starting motor by providing a rich gas mixture. Prime the carburetor in the usual way and choke the air inlet. All of the rich mixture will not reach the cylinders as much of it will condense on the cold walls of the intake manifold. In doing this you remove a goodly portion of the burden that would otherwise be demanded from the battery.

Take time in warming up the engine in cold weather. Remember that nothing is gained by trying to hurry it. If the car has been standing twenty-four hours the oil has drained back from the cylinder walls and bearing surfaces, and the crankcase oil, if cold, is sluggish and viscous, and will take a little time to get back to its normal operating condition and this only when the engine is thoroughly warm.

Don't jump upon the accelerator and let the engine race like a Lewis gun, for with poor lubrication this method usually results in serious damage and is bound to have a bad effect if practiced regularly. Run the engine slowly for three minutes before putting it to work and you economize not only in repair bills but also in oil and gasoline.

WATCH your radiator for leaks especially at this time of year. It will naturally be filled with anti-freezing liquid in winter and while a small leak in the system in summer would not be important, the present high price of non-freeze fluids should encourage the car owner to make a careful inspection every so often.

When the foot throttle or accelerator came into general use the hand throttle on the steering column has appeared nonessential to many drivers, while in a few cases manufacturers have ceased to fit it upon the car at all.

The use of the hand throttle under certain conditions will prove to be an economical fact that will astonish many. On a long straight drive or slightly curved roads, in parks, on boulevards, it is advisable to use the hand throttle instead of the accelerator because of the fact that it maintains the throttle butterfly valve in a steady condition instead of the usual fluttering, vibrating position, as is almost continually the case when the accelerator is used.

On rough roads this is especially noticeable, for the vibration of the floor boards causes the foot to keep the accelerator pedal in slight but constant vibration. Therefore the carburetor cannot do its best work under these conditions and a constant flow of gas when the hand throttle is set will give more even running and will relieve the rest of the chassis and tires from the strain of constant acceleration, of "picking up" and "slowing down."

Now is the time to buy your hood and radiator cover. You promise yourself to get these some time, but many put it off from day to day and then it is never done. The result will be that a robe will be used as a makeshift, or possibly nothing at all is provided to protect

Digitized by Google

the inside of your engine when it is standing. This results in a waste of fuel. A cold engine means imperfect vaporation and congealed oil. The former necessitates opening the throttle wider because the mixture is not so efficient and the latter, friction in the engine which calls for still further opening of the throttle.

So if operating the car with a cold engine is bad what usually happens is that the engine is left running, thus insuring its good working condition. This is a waste of gasoline and oil and any owner who will take the trouble to find out will be surprised at the amount of fuel that will be consumed in a day in this way.

And watch your windshield, for glass is easily broken on a morning when the mercury is trying to creep down to the thermometer bulb. The cold makes the glass more brittle and often a sharp jerk on the windshield to change its position will crack the glass.

When you come in from a long drive and the car top is covered with snow, brush the top by folding it back, and then allow it to dry with the top up. A folded top, if damp, will deteriorate rapidly and will soon discolor and crack. Don't clean a top with gasoline for gasoline will ruin any rubber which is in the fabric or construction. When the top does need cleaning use good castile soap and a scrubbing brush. Soap and water will have an equally good effect on the celluloid windows, too.

THE driver who fails to equip his car with some form of anti-skid chain for the coming months is neglecting a sane precaution, but these should only be used when absolutely necessary. They should be fitted loose enough so that they will work around the tire and accordingly distribute the strain, but they should not be so loose as to form a "bundle" and bring about the pounding and bumping which is very detrimental to the tread. Your tire man will tell you that chains are a form of insurance against accident. You will pay for them in the shortened life of your tires. The wear due to chains is very slight and the insurance is well worth while. Chains applied too tight will considerably shorten the life of the tires. They will not prevent skidding if applied in this manner, and will bite into the tread and play the part of a skate.

This is especially true on wet or icy pavements and the bite in the tread can easily be recognized and the cause determined on account of the chain-link impression on the tread, which is usually in evidence. Chains should never be applied when the carcass of the tire is exposed. Disregard of this point not only proves costly but the blow-out takes place at a most inconvenient time, because chains are usually used on rainy days, on muddy roads, or during the winter after a heavy snowfall.

Don't trust to your chains to prevent skidding on pavements. A skid usually results from the lack of a secure grip of the tires on the pavement. It sometimes happens on a dry roadway but usually this is due to excessive speed. Some drivers find that their cars skid nearly every time they put on the brakes, especially on a wet pavement.

This is probably due to the brakes not being adjusted to the same tension so that one brake takes hold sooner than the other. This condition will naturally wear off one tread sooner than the other and cause the car to swing around because of the one-sided resistance.

If the brakes take hold equally and the same thing happens it may be that the driver applies the brakes too suddenly, or the brakes may grab or lock. In either case the result is the same, the wheels lock and slide along on one place in the tire and the resistance to forward motion is the same as that of side motion so that it is just as easy for the car to slide sideways as forward.

The brake may grip too suddenly because of the fact that rivets are sticking up and jamming between the drum and the shoe, or perhaps the drum may have become scarred or bent.

Most owners have the idea that there is little difference in gasoline economy at different speeds. Every car has its own speed, or to state more clearly, a certain speed at which it will operate more efficiently. This is generally between fifteen and twenty-five miles an hour and the driver can usually tell from the sound of his engine and the feel of the car under him just where this speed lies, as he comes to understand it thoroughly. The slower the car is driven the better the economy and this holds good for tires and general wear and tear of the car's mechanism.

One of the most common causes of lost gasoline is that of flooding the carburetor, which is usually occasioned by foreign elements, such as dirt and dust, preventing the needle valve, that controls the flow of gasoline to the float chamber from seating. This valve shuts off the supply when the float attains its proper level, but if the needle will not seat, the gasoline continues to flow and, of course, is wasted.

Strain the Gasoline.

This defect can be remedied by carefully straining all gasoline used, by opening the drain cock of the gasoline filter and by occasionally draining the float chamber of the carburetor. If the flooding still continues, the float should be examined for it probably leaks. The careful motorist shuts off his gasoline supply each night.

Remember that an economical use of momentum means economy in gasoline and in obeying this rule for a month you will notice the difference in the gasoline bill. When you are about to make a stop, close the throttle and push out the clutch and "coast," applying the brake gently when your destination is reached. If you constantly practice this little saving you will subtract a lot from the running expense.

A very frequent cause of spark plug trouble is oil or particles of carbon collecting between the points and sooting of the porcelain. Remove the oil or carbon. If the carbon on the porcelain is hard, do not try and scrape it off. The plug may be soaked in kerosene until the carbon is soft enough to wipe off with a cloth.

Points out of adjustment or burned away will cause missing and the plug points should be set to approxi-

Digitized by Google

mately 1/32 of an inch for the best fuel consumption and economy. The distance, of course, will vary slightly with different engines but this is a good rule to follow.

The breaker points on the magneto should be smooth and in proper adjustment to get the most out of the mixture. When the points wear and the gap becomes too large the spark will not be as strong, the explosion not so powerful. In this case more gasoline would be required.

Ignition Troubles.

Trouble with the ignition system is one of the greatest causes of annoyance for the simple reason that ignition is practically a mystery to most automobile owners. The system is either let alone or neglected when it should be taken care of or the owner goes to the other extreme and injures it in a way to cause trouble.

When trouble occurs in the ignition, do not lift the hood and shake a few wires. Take the time to get under the car and trace each wire to its source or to the mechanism to which it carries the current, and satisfy yourself as to just what condition that particular wire is in.

Looseness where the wire joins the terminal will make all the difference in the world between satisfactory operation and trouble. Many times a self-starter has failed to operate for no other reason than this. Keep the platinum points clean and blow out the carbon dust from the wornout brushes before there is a chance of current leaks or of a short circuit.

When turning on the headlights, switch on the dimmer first. This causes a gradual heating of the filament as opposed to the sudden hot flash of the brighter lights, which in many cases, burns out the filament.

The various incidents related prove that one is unwise who takes things for granted. It is also important to bear in mind that it is not wise to use too much logic in trouble hunting, for often the solution is far from logical. It is wise to reason out as carefully as possible the situation that is at fault and then go about it in the most practical manner.

Oxy-Acetylene Welding Methods

There Is No Subject of More Vital Importance To the Repair Man or Mechanic Than This.

BY J. F. SPRINGER

OXY-ACETYLENE welding is a subject that touches pretty much every important line of activity having to do with metals. The building and repair of locomotives and other railroad rolling stock constitute one large field of operations. The construction and repair of passenger automobiles, motor trucks and tractors provide another. The manufacture of non-ferrous utensils and applications to brass, copper and aluminum work provide still another. The oxy-acetylene torch is, in fact, the great instrument of construction and repair pretty much everywhere that the leading industrial metals are used.

It is a remarkable instrument in repair, since it is able not only to unite metals but to replace lost parts. Its portability lends itself particularly to repairs. When the plumber, with its aid, is able to go into residences and public buildings and repair on the spot, breaks in cast-iron and other metals that have hitherto been difficult, then we have proof of a superlative repair process. The oxy-acetylene process is just the procedure to reach such cases.

The amateur machine shop, the big machine shop, the railroad round house, the plumber's shop, the foundry, the factory turning out miscellaneous non-ferrous work —all these, and others, have use for the oxy-acetylene torch, for the simple reason that they are often up against problems which the oxy-acetylene torch can and does solve.

A very important line of activity in which oxy-acetylene welding has been found to be of tremendous value is in the welding of sheet metal. Such work as welding the seams in the nickel-plated containers of the Edison storage battery is just the kind of work in which the oxy-acetylene process is very valuable.

Both in new and repair work, the process is a wonderful adjunct. But it must be intelligently used. It is the purpose of the present series of articles to set forth the fundamental methods of handling work. Those interested are urged to read attentively and to skip nothing whether it seems useful or not.

Oxy-acetylene welding is carried out, ordinarily, by means of a torch or blow-pipe held in the hand. There are two gases passing through the instrument and issuing from the burner. These are oxygen and acetylene. A double flame is formed. The inner white flame is quite small and may be only 1/4 or 3/8 of an inch long. The outer flame is quite large and forms a kind of envelope.

It is with the tip of the little white flame that the work is chiefly done. Here we have a temperature of something like 5000 or 5500 degrees F., or perhaps more. It is largely because of the enormous temperature that work covering such a wide range may be done.

In fact, all the usual industrial metals yield to this temperature. There is no trouble encountered in melting gold, silver, iron, cast iron, steel, copper, brass, bronze,

Digitized by Google

aluminum, tin, lead, etc. Consequently, the oxy-acetylene torch has a very wide variety of uses.

Cast Iron Welding.

Cast iron was one of the first materials dealt with commercially. Almost any break in cast iron may be repaired. For example, if an engine water jacket has cracked for any cause—as from the freezing of contained water—the oxy-acetylene process is just the thing for repairs. Furthermore, unless the break is at some inaccessible point, the torch, together with the oxygen and acetylene supplies, may be brought to the spot and the radiator repaired not only without removal but without dismantling the engine in many instances.

Again, a break may occur in a steel channel frame section of an automobile. The repairs may be made by the oxy-acetylene process without disassembling the machine. In fact, in a case like this, the process comes in in a double manner. That is to say, by means of a suitable

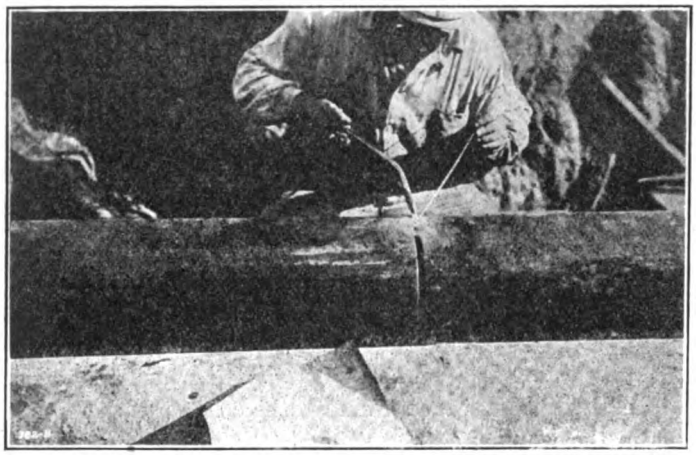

Fig. 1—Joining Two 20-Foot Sections of Extra Heavy Pipe, ⅜ Inch Thick and Ten Inches in Diameter, by Means of Prest-O-Lite Oxy-Acetylene Process.

compound torch or a suitable attachment to the welding torch, the process may be utilized to cut out damaged members as well as to weld up seams or rivets. A high pressure jet of pure oxygen associated with the ordinary oxy-acetylene welding flame enables the operator to cut steel both thick and thin, both cast and rolled. Steel may be cut but not other metals.

But to go back to the simple welding operation. It may often be used to build up a part that has been broken off and lost. It may be a bronze or a brass knob or part of the control wheel or other device, attached to a valve. In such cases, if conditions are favorable, the oxy-acetylene process may be brought in not merely to secure the two pieces together but to build up the whole of that which is lost and gone.

The powerful little white flame melts off bronze or brass from a rod of the material and enables the operator to build up and fashion the lost part—to add it onto the main portion. This may at times be done without removing anything. The finishing of the new piece is a job for the file and similar tools.

Let us suppose, for example, that a casting has been broken across. It doesn't matter whether it is cast iron, brass, aluminum, steel—the oxy-acetylene process is well adapted to mend the break and unite the two parts. It doesn't matter whether the casting is a small one, such as a radiator unit or a part belonging to the steam plant in the basement of an apartment house. Or it may be a frame or a bracket belonging to railway equipment. It may be a big casting, such as the base of a big machine. Big or little, it is all the same to the oxy-acetylene process.

The casting may be new and still in the shop; it may be old and at the bottom of a pit. New or old, under shelter or out of doors, near the shop or far from it—it is all the same. Torches may be taken to the work and also tanks containing the gases oxygen and acetylene. Or, the work may be brought to the shop. Some shops have the acetylene piped to various points of convenience and secure it by flexible or other branch piping.

Grafting on Unlike Metals.

The job in hand may require that a malleable iron piece be secured to a rolled steel part; or it may be that a piece of hard brass needs to be united to a soft brass part—it is a job for the oxy-acetylene process. Whether the operator can do it or not will depened largely on how much he knows about the process.

There are, naturally, some jobs that cannot be handled by any process. The break, for example, may be located where neither the oxy-acetylene torch nor any other instrument doing similar work can be inserted. In short, the job may be out of reach. Then there are jobs which can be done, but require more than ordinary skill and knowledge. Just an ordinary welding man could hardly be expected to weld up a break in a high-pressure copper steam pipe on an ocean liner. It takes skill and knowledge. But there is such an enormous amount of new and repair work that the ordinary oxy-acetylene welder really can do and do acceptably that we need not be worried if some jobs are beyond him.

The great power of the oxy-acetylene flame is the thing that enables it to conquer pretty much any metal. But this power is, at the same time, the thing that will make trouble for the careless workman. The very ease with which metal may be melted makes it necessary to be on the watch lest the flame be allowed to do too much. Thin metal, the melting temperature of which is rather low, must be handled wisely, otherwise damage to the metal will be done.

So it will be well for the beginner to face the fact that oxy-acetylene welding is an art to be studied seriously and not just picked up by watching some one at work. What the welder needs to know is the construction and mode of operation of his torch; the methods that have been found adapted to various classes of work; and the reasons for the various rules and directions.

Just now, let us pay some attention to the flames which issue, as it were, from the torch. The little white flame constitutes the welding tool. Ordinarily, the tip of this flame is what is used. The tip marks the hot spot. The

Digitized by Google

character of the flame closer up to the burner and farther away is different from what it is in the region of the tip end.

Nearer the burner there are understood to be three gases flowing along—oxygen, gaseous carbon and hydrogen. The oxygen will generally be undesirable for contact with hot metal. The carbon will also be undesirable, but perhaps for a less number of jobs. The hydrogen will often do no harm. If the reader has grasped the point here, he will readily understand that he should be on his guard lest this part of the flame flow against the work.

Further out from the burner, at points beyond the end of the tip of the white flame, the conditions are more favorable. In fact, all this region, including the big enveloping flame, acts as a protection to hot metal. It is eager for oxygen and readily licks it up, whether the oxygen be stray oxygen that has come through the torch and has failed to unite with either the carbon or the hydrogen, or whether the oxygen comes from the surrounding atmosphere.

The Construction of the Torch.

It is important that the user as well as the prospective purchaser of an oxy-acetylene outfit understand something of the construction features of leading commercial torches. It will, ordinarily, be best for a purchaser to secure a torch that is backed by substantial reputation and responsibility. Otherwise, he may find himself in possession of an instrument which will consume an *inordinate amount of oxygen.*

As oxygen is an expensive gas, this condition of affairs would mean continual loss through waste. A high class torch will consume around 25 per cent more oxygen than acetylene. There is probably nothing gained when this figure is exceeded, but something is lost through wastage. A torch which will operate day in and day out at a lower figure is an excellent torch from the point of view of economical consumption of oxygen.

As regards performance, a torch may be tested in the following manner: Let standard work be carried on—that is, work requiring a neutral adjustment of the flame, which neutral condition corresponds to a sharply outlined single inner flame of brilliant white. Such work is, in general, that which consists of rolled or cast steel, iron or nickel. The consumption of both gases is to be noted by means of the indicators. The longer the period, or the sum of the divisions of the period, the better the final result. The relative amounts of oxygen and acetylene will show whether the torch is operated to high advantage.

Oxygen will ordinarily be brought and not made on the spot. It will come in steel containers and will be under high pressure. The high pressure is needed to reduce transportation costs. Acetylene may be made or not. This gas, as it enters the torch, may be under a very low pressure or else under a medium pressure. The construction of the torches differ in accordance with the use of gas under medium or low pressure; so that it is necessary to make selection to correspond.

The business of the torch is to receive the two gases, to mix them, and without danger of a flare-back to discharge the mixture from a tip or burner under considerable pressure.

It is necessary that the mixture issue from the burner at a fairly rapid rate. Otherwise, the speed of flame transmission may be greater than the rate of forward movement of the mixture. In this case, the flame would enter the burner. This requirement that the mixture shall issue under considerable pressure means, even in the case of the use of low-pressure acetylene, that the *oxygen* shall be under considerable pressure.

Preventing Flare-Back.

The prevention of a flare-back is, in part, taken care of by pressure. But this is hardly precaution enough. A favorite method of preventing a flare-back from retreating back of the torch itself, and possibly reaching the acetylene reservoir or tank is to use a porous material as a packing in a suitable location inside the torch—or rather, torch handle—and compel the gas or gases to pass through it. Where acetylene is generated in a fixed generator at a shop, a high class generator will probably be so arranged that a flare-back would have to pass through water to get to the storage compartment or tank.

Fig. 2—Welding Gas Pipe "On the Road"; Insert at Right Shows a Cutting Operation. The Big Advantage of Oxy-Acetylene Welding Is That Work Can Be Done Practically Anywhere.

The mixing is one of the most important functions of the torch. Upon the thoroughness of the mixture depends the economy of oxygen consumption. Let me explain. The oxy-acetylene process depends upon limiting the combustion of the carbon, derived from the explosion of the acetylene, to carbon monoxide. In order to get this result, and thus avoid combustion to carbon dioxide, the supply of oxygen is limited. The proper amount re-

Digitized by Google

quired is exactly the same as the volume of acetylene. Any oxygen over and above is really not wanted. This is understood to be the state of affairs.

The reader may now ask: Why then is a greater amount of oxygen supplied than of acetylene? The reason appears to be just this. An excess of oxygen is necessary in order to make sure that every bit or particle of acetylene will have *alongside* or *near* it a corresponding bit or particle of oxygen. If the mixing could be done to perfection, then precisely the same volumes of oxygen and acetylene should be supplied the torch. *The excess of oxygen required by a torch is to be viewed as the measure of its imperfection in securing a complete intermingling of the two gases.* There is probably no commercial torch in existence capable of perfect mixing. The thing to do, then—other things being equal—is to select and use the one requiring the smallest excess of oxygen.

(To be continued.)

SHOW DATES THAT HAVE BEEN FIXED.

February 22-March 1

April 5-12
Montreal, Can. National Motor Show for Eastern Canada.

WELL KNOWN AUTOMOBILE MAN CELEBRATES 85TH BIRTHDAY

As a general rule we do not publish news items or personal notes unless the person or the news is of particular importance. In this case, we feel that all our readers will be interested in knowing that Mr. S. C. Johnson of Racine has just celebrated his 85th birthday.

His employes, 150 in number, gathered to congratulate him and present him with a basket of 85 roses and a pair of binoculars. Mr. Johnson retaliated by presenting his employes with $15,000 in Liberty Bonds, to be distributed on a basis of number of years service given by the employee.

Mr. Johnson, though 85 years old (or young as his friends have it), is still the active financial head of the business of the S. C. Johnson & Son firm. He spends from three to four hours daily at his office. He started in his present business when he was 48 years old, in 1882, and his concern has grown from an obscure factory to one of the largest wax polishing businesses in the world.

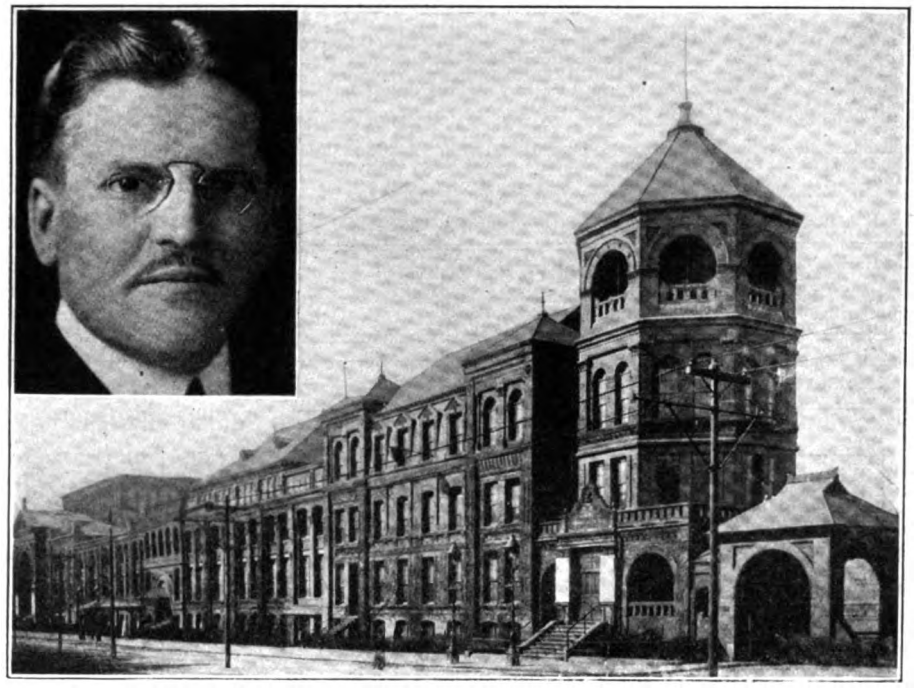
The Boston Automobile Show

THE "spring styles" in motor cars did not materialize at the New York show mainly because the manufacturer did not have time enough to produce them in the interval of the signing of the armistice and the opening of the New York exhibition.

The Boston Show opening on March 15 will give most of the manufacturers just enough time to turn out the 1920 models. A month and a half will mean much in auto production and when the doors of Mechanics Building open on the 1919 show they will reveal an exhibit of cars of many new designs and many mechanical changes.



The new things will not be revolutionary. The cars will be lighter, the wheel-base shortened and the body design will be much neater and allow of more comfort. There will be greater ease and reliability of engine and machine construction. This will make the strongest appeal to the individual owner who is his own mechanic. The war has had the effect of making thousands of owners fairly expert mechanics and the tendency in construction will be in making motors, gears, brakes and other parts more available for repairs outside of the service station.

The Boston show will reveal more different makes than any of the big shows of the country. This will be due to the fact that many manufacturers will not be ready until that time to show their products.

"While we will not have an exhibition of trucks yet I look forward to the greatest crowd of buyers that ever attended a Boston show," says Chester I. Campbell, who has managed the show since its inception. "There are more new prospective buyers of automobiles in the New England market than at any other time in the history of the industry. Again automobiles are going to be scarce as it will be impossible for the makers to reach their highest point of production until June.

"The industry as a whole is filled with enthusiasm and looks for the greatest buying year in history. In a recent visit to Detroit I was privileged to look over several new designs and I understand that when the Boston show opens we will exhibit the most advanced styles yet shown by the trade."

The accessory man will as usual be about a year ahead of the motor car manufacturer in equipment. Some wonderful innovations will be shown, all adding to the ease of driving or short cuts to labor and economy. The accessory department will bring all the big manufacturers of equipment to the Boston show.

The Mechanics Building in Which Will Be Held the Big Boston Show. Insert, Chester I. Campbell, the Manager.

PROLONGED HIS JOB.

A motorist touring in a Western State got stalled in a tenacious mudhole. While making a vain attempt to escape, a boy appeared with a team of horses.

"Haul you out, mister?"

"How much do you want?"

"Three dollars."

After a long and fruitless argument the motorist was pulled to dry land.

After handing over the money the motorist said: "Do you haul many cars out in a day?"

"I have pulled out twelve to-day."

"Do you work nights too?"

"Yes, at night I haul water for the mudhole."—New Departure News.

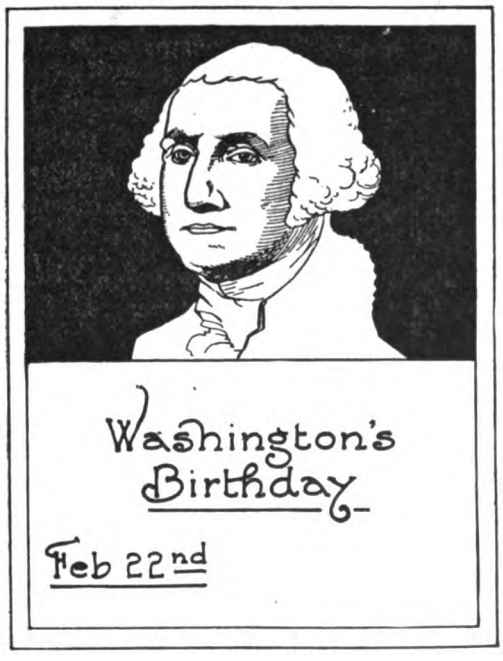
TERMS OF SUBSCRIPTION.

One Copy, One Year, Including Postage $1.00
One Copy, Six Months ..... 60 cents
Single Number ..... 10 cents
Except in zones 7 and 8, comprising the following States: Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington, Wyoming. In all these the rate is $2.00 per year, made necessary by the unjust increase on the part of Congress in second class Postage.
Foreign Subscriptions ..... $1.50, or 6s. 3d.



Remittances should be made by Express Money Order, Draft, Post Office Order or Registered Letter. Foreign remittances, where possible, by International Money Order.

ADVERTISING RATES SUPPLIED ON APPLICATION.

The Automobile Dealer and Repairer in New Zealand.

Mr. R. Hill, Madras House, Devonport, Auckland, New Zealand, is our accredited representative in New Zealand for obtaining new subscriptions.

MISSING NUMBERS.—Our readers are requested to remember that we are always pleased to re-send numbers which have gone astray in the mails.

Let Us Give Reverence.

LET us not forget to give due reverence to our first President, George Washington. In the flush of our present prosperity we are prone to feel that our happiness and welfare is wholly due to our own efforts. We forget those who have gone before, whose broad-minded policies have made us what we are.

Let us celebrate the birthday of our first President with respect and honor. We know him to have been a man who put aside all personal feelings and did only that which would make for the glory of the nation as a whole. We know that he stood for what every red blooded American stands for—Liberty and Justice.

Will You Let Your Pocketbook Rule or Will You Always Remain Patriotic?

NOW that peace has been declared, America is brought face to face with the biggest problem of the century, that of reconstruction. It is the duty of every reader to think over a few of these reconstruction problems, for they affect every individual in the United States.

On November 11th, every patriotic American went wild with joy, celebrated by ringing bells, by blowing whistles, by cheering, or if he could do no better, by throwing confetti out of his office windows. Everybody was at the height of their enthusiasm. They were 100% Americans and wanted everybody to know it.

Will this spirit remain during the coming year? You are 100% American to-day, Mr. Reader. Will you be as strong an American a year from to-day? During those troublesome days of 1914 to 1916, England, France and other nations of Europe read American reports with a sarcastic smile. America to them was a nation of "dollar chasers."

The American, to them, was a business man, cold-blooded and cool, influenced by nothing that was not preceded by a dollar sign. To the nations of Europe this attitude brought the greatest disdain. Those nations openly stated that we would not enter the war unless America could gain financially by so doing.

Germany and her allies not only thought this but were certain of it. Germany in her overbearing and domineering policies took advantage of our "too proud to fight" attitude, attributing it to the dollar influence and did not hesitate to encroach upon America's rights. She seized our shipping, murdered our citizens, still waiting with a disdainful smile.

Then came the Lusitania and the torpedoing of other defenseless boats, and America entered the great war. Did she enter it because of financial gain or because of humanity's call? Germany still claimed that America was in it from selfish motives. Many of the other European countries still brought up the same question. If America entered on the side of justice, why had she not made use of her armies before when Belgium had been devastated, when France had been burglarized and when London had been bombed?

The attitude at the time was easy to explain. America wanted to be neutral and keep out of it if she could. America is not easily excited, but when America is aroused she is like a good natured bulldog that does not

Digitized by Google

fight unless it is necessary, but when fighting is necessary clings on until death.

Since America entered the war it has been shown that America entered the war for justice. America has sacrificed money like water. It has not been a question of cost, it has been a question of winning. We have successfully proven to the world that the dollar sign is not before us all of the time.

Fellow citizens and Americans, are we going to allow the other nations of the earth to regard us again with that same feeling? Are we going to let the dollar sign rule us in the future? No, *not* if we are *true* Americans.

Since war was declared, America has shown that she is fully capable of taking care of herself. She is self-supporting in every sense of the word. American-made tools, dyes, machinery, surgical instruments, toys, instruments, furniture, novelties at the present time are just as good as any we have imported or can import from germany or her allies.

And even if they were not, would you purchase german, Austrian or Turkish goods in the future? Do you intend to build up germany economically by purchasing her products? Are you going to renounce your patriotism, renounce your American manufacturing friend who has loyally stood behind America during the war and discard his goods in favor of enemy-made products?

If you decide in the affirmative, remember two things. First, you sacrifice your self-respect, and second you hurt your friend or your brother who is perhaps employed by a manufacturer making goods in competition with those sold by germany.

Doubtless germany can and will sell us products at a lower rate than we can purchase from our own manufacturers in some cases. She needs the money and needs it badly. She must have the money and even if she sells her goods at a sacrifice, she has conquered economically. She has successfully stifled all chance for competition from America.

By killing American industries, not only can she win the economical war in America, but she can prevent us from exporting goods. An American manufacturer cannot afford to export goods if he cannot sell his goods at home. With the importation of german products comes the question of the American working man.

You who are earning from $5 to $10 a day, are you willing to work for $1 a day again? The manufacturing business is a complex network of machinery. One business depends upon another. One business is closely interlocked with a dozen other manufacturing plants. The failure of one house puts a strain upon some other department of this gigantic machine.

No matter what industry you represent or are employed by, Mr. Reader, the effect upon you is indirect, but is harmful just the same. Foreign trade is a storm cloud. It may burst at any minute and engulf you. Unless you are willing to surrender economically to the enemy, your task has just begun.

We have won the war. We have the assassin on his back and begging for mercy. Let us not hand him a pair of steel knuckles and a blackjack, and let him up again. We can be merciful to him. Let him up, dress his wounds, but we can insist that justice be done and the assassin put in a position where he will be unable to strike us in the back as soon as he has recuperated.

Don't let our boys come home and find that their work has gone for nothing. Don't let them come home to the sound of german-made whistles, the beat of german drums, to eat with german-made cutlery and see german-made pictures hanging on our walls.

You as an individual of the biggest free country in the world can use your voice in this matter. Do your part and your conscience will be clear. Pledge yourself not to use any german-made goods that can be manufactured by red-blooded Americans in America. Pledge yourself not to let price influence you into purchasing a german article, a similar one which may be purchased "made in America."

Insure Your Car Against Theft.

EVERY car owner should insure his car against theft. It is not sufficient in leaving a car always to lock it or try to lock it. Thieves sometimes are able to get the best of any ordinary locking device, and it frequently happens that a driver who only expects to leave his car for two or three minutes does not perceive the necessity of locking it.

In New Rochelle recently a man borrowed a car from a friend to take a couple of young ladies home. While escorting them from the car to the front door of their residence the driver left the car of course without locking it, because he was only going to be a few feet away, but before he reached the door of the house a man jumped into the car and got away with it.

Some time since a lady, uptown in New York, bought a $6,000 car. After it was installed in her garage she called up the driver and ordered him to bring the car around to her house. He did so, and ran up the steps to the front door to ring the bell and notify her that the car was ready. During that brief interval a thief jumped into the car and succeeded in getting away with it.

While there are a number of different kinds of insurance that can be obtained on a car to advantage, one of the most important is to insure against theft.

A Wonderful Industry.

MOST people will be surprised to learn that there are in use in the United States to-day nearly 6,000,000 motor vehicles. The production of passenger cars for 1918 in spite of war conditions was over 900,000, and it appears that all of these cars must have been sold. It is estimated that the production of passenger cars for 1919 will probably reach at least 1,500,000.

Digitized by Google

IN spite of laws imposing penalties and in spite of all the precautions that are taken, the number of people killed by automobiles in 1918 was greater than ever before. Fatalities in the city of New York alone were 748 as compared with 528 for the year of 1917.

The figures referred to were compiled by the secretary of the chief medical examiner, and therefore can be relied upon as accurate.

To what extent the blame should be fixed upon drivers of cars and upon pedestrians themselves it would be difficult to determine. Even the most careful man or woman sometimes experiences a temporary lapse of memory or attention and is hit by a car.

Sometimes the accident is caused by the timidity of the pedestrian who runs back and forth trying to avoid a coming car and manages to get right in the way in spite of the efforts of the car driver to avoid a collision.

People should not be confused in crossing streets; if they see a car coming and find they cannot either retreat or go ahead they should simply stand still. The driver of the car will be very likely to miss them, for nobody would deliberately run down a person standing still in the middle of the street.

Something should be done in the way of depriving careless drivers of their licenses in addition to imposing heavy fines and perhaps imprisonment.

There is no question at all that automobiles are permitted to run altogether too fast on city streets. The speed should be limited and drivers not conforming to regulations should be arrested.

Driving Without a License: A young gentleman of Newark, N. J., gently bumped the auto he was driving into another resident of that town. For a moment the first gentleman thought he would have to part with some of his money in payment of a nice, fat fine, but his victim scrambled to his feet, refusing medical attention, and bolted into his house, which was nearby. The driver was about to drive away, feeling quite happy, when the police got him, and spoiled his dream of freedom by arresting him on the charge of driving without a license.

Reckless Driving: A five-year-old child was killed in Brooklyn, N. Y., within a hundred feet of her home. She had been to a store and was returning when she was run down by a truck. The driver was arrested, charged with reckless driving.

Child Killed, Driver Released: A child was killed in Buffalo, N. Y., the other day after becoming confused in crossing the street. The driver, who claimed that she walked right in front of the machine, was released, as the unfortunate accident was considered no fault of his.

Machine Hits Train: A great many automobile accidents occur at railroad crossings; most often the driver of the automobile being at fault. Too often the driver misjudges the distance, and at the hospital the next day he listens to an account of the accident in a dazed way. The following, however, was no fault of the driver's. It occurred in Boston, Mass. The slippery condition of the street, which is on a down grade, was responsible for the accident. The flagman at the crossing tried to warn the occupants of the car, but they could not stop it; the tender of the engine, which was running backwards, struck the automobile fairly between the front and rear wheels. One man was killed, and the other badly injured.

"Want a Ride?" With some such words, a native of West Roxbury, Mass., invited a friend to ride with him. His car trundled along at 45 miles per, and turned over. The friend died two days later in the hospital, but the driver escaped injuries. He was charged with reckless driving, while under the influence of liquor.

Hits Three Machines: Before a driver of San Francisco, Cal., could be taken into custody, he had distinguished himself forever by hitting three machines on one block. It takes no great stretch of the imagination to surmise that John Barleycorn was riding with him. He was, very much so, thank you.

Girl Seriously Hurt: Crossing a street of Rochester, N. Y., in front of her school, a child was struck by an automobile and thrown with such force to the snow-covered pavement that she was all but made unconscious. One of the wheels of the machine passed over her body as she lay on the pavement. She was very seriously injured. The police blotter shows that the man was not driving his car at an excessive rate of speed. It is said that the child ran sideways into the street, and was struck and thrown under the machine.

Two Automobiles in Collision: A collision of two automobiles in Philadelphia not long ago resulted in both machines being damaged. One was hurled upon the sidewalk. The operators of the machines were arrested on a charge of reckless driving.

Crashes Into Trolley Pole: In turning out of the way of a horse and carriage, the driver of a car lost control of his car and crashed into a trolley pole. All three passengers were badly bruised, and the operator of the car was pitched through the windshield. This accident occurred in the Bronx, New York.

A Visit to Clay County, Illinois

What Our Contributor Has Learned From a Trip to an Up-To-Date Garage in a Thriving Western Town

BY JAMES F. HOBART,

MR. HOBART," said a salesman whom the writer recently met in a Clay County (Ill.) garage, "how is it that when you have to wait a couple of hours for a train you won't sit comfortably in the hotel lobby instead of rushing around to the nearest garage and spending your time among a lot of old automobiles, old tires and other junk? Seems to me you don't look out for comfort very much?"

Perhaps the above is true, but nevertheless the writer will be found in the garage every time and he can truly say that never yet has he spent a quarter of an hour in a live repair garage without finding something well worth while—well worth being passed along to Automobile Dealer and Repairer readers. So it was this time. Just across from the hotel at Flora, Ill., is a large sign, bearing the words:

THE LINCOLN TRAIL GARAGE

The writer found that the business had developed in about three years, from a little one-man affair in a very small building, to a very large concern, employing a large force of mechanics, particularly in summer, and doing a large business in the specialties of tire and battery rebuilding and repair. The regular auto repair section was also very well equipped, a lathe, emery grinder, drill press and air pump being in evidence, together with a "rasp" wheel for grinding rubber tires and treads, a well-equipped vulcanizing room which contained about every tool and convenience necessary for rebuilding tires, a large outfit of vulcanizers of various sizes and kinds, and plenty of good work benches and overhead hanging places for tires in process of repair.

A Valve Unscrewing Tool.

On one of the benches in the tire room, and made fast to that bench, the writer saw a homemade revolving wrench arrangement for inserting and removing air valve tubes from tires, a little machine which saved a whole lot of time during the year. The machine as shown by Fig. 1 was very simple and easily made.

A piece of gas or steam pipe of the proper size was selected for the body of the wrench and one end of the pipe was forged to fit the tubes to be handled as shown at A. The other end of the pipe was fitted with a couple of elbows and nipples, one of the latter being without thread on the outer end, and rounded to act as a crank without hurting the hand. A couple of wooden blocks served as shown to attach the revolving wrench to one of the benches, the blocks being so located that the stroke of the crank came outside of the end of the bench.

When tires were to be repaired, the surfaces to be joined were cleaned thoroughly and in that work the "rasp" wheel shown by Fig. 2 played a very large part. This tool was merely a piece of tool steel about six inches in diameter and made to fit the mandrel of an ordinary grinding machine and is interchangeable thereon with the usual emery or carborundum grinding wheels.

But in this garage two separate stands for two wheels each are used, a separate stand being provided for tire work, of which one end of the mandrel is fitted with the "rasp" wheel, the other mandrel end with an ordinary wire brush. The edges of tire parts are reduced with the rasp wheel, then the "finishing touch" is given with the wire brush; which also removes every vestige of dirt from the rubber surfaces upon which it is used.

Two separate stands are used to prevent any possibility of ordinary machine repair work being done with the rasp wheel or with the wire wheel which accompanies the rasp wheel. Should these tools be used for ordinary work, grease would surely get upon the wheels used for tire work and then it would be "all off" with good vulcanizing work on tires. Hence the tire wheel stand is NEVER used by the garage men save upon tire work.

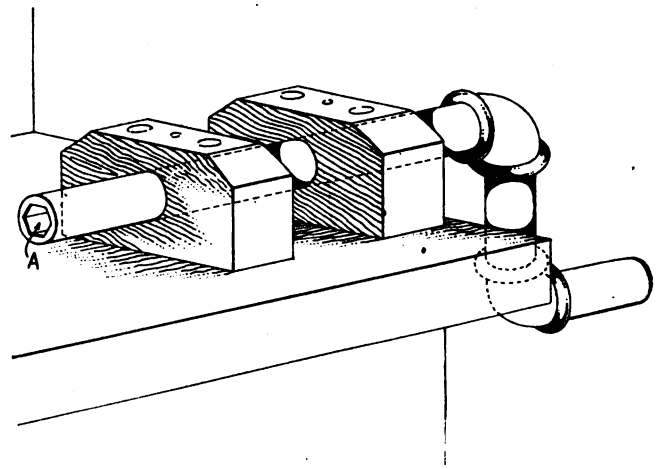

Fig. 1—A Handy Tire Valve Nut Removing Tool.

The rasp wheel is turned to shape after being annealed, then the face is cut full of raised rasp teeth exactly as a farrier's hoof rasp is cut, after which the steel is hardened. When one of these useful rasp wheels becomes worn and dull, it is quite possible to anneal and put it in a lathe, turn off the holes from which the old teeth were raised, then with a chisel, raise up some new teeth, harden the disc again, and it will be as good as a new wheel, save that its diameter is less.

A Handy Work Bench.

Almost in the middle of the garage floor was standing a bench, the like of which the writer never saw before, but which should be in every large repair shop.

Digitized by Google

The bench was all of twelve feet long and eight feet wide. It was very strongly made of cypress lumber with maple top planks where the work was done. Fig. 3 gives an idea of this bench. Upon opposite corners are two ironworker's vises, B and I, one being an ordinary vise with five-inch jaws, the other, a huge affair with seven-inch jaws and with grip enough to hold a bull moose!

At C a pipe vise has been permanently fixed to the bench and no mechanic who has not had the use of one of these little tools can ever be aware of its great convenience and general utility. New uses will be found for a pipe vise almost every day, once one is put into use. They may be purchased for a couple of dollars and are at times worth ten times as much for a single job.

A large surface plate was located upon one corner of the bench at D, and by placing a sheet of emery cloth flat upon the clean surface of the plate a very good job of flat grinding could be done by moving the work around

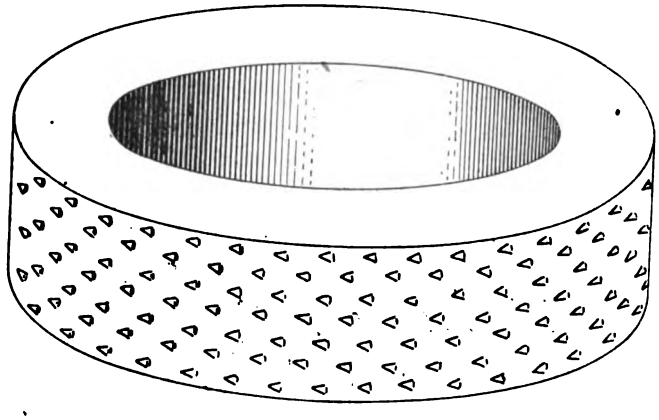

Fig. 2—A Tire Rasp.

upon the emery cloth with the fingers. Many a piston ring was ground to a fit in that manner.

A shelf about two feet wide placed at E served as a most admirable support for such tools as were to be kept at the bench all the time. But sometimes the manager looked "sidewise" at that shelf because of the hard work he had in making the workmen keep the bench and the shelf in particular "rid-up" of choice collections of junk which seemed to collect there almost overnight.

One foreman wanted to cut the big bench and place the two halves—split lengthwise—along the wall, making two narrow benches. But the manager said "no." He claimed that there was twice as much working space adjacent to the big bench as it stood in the middle of the shop-space floor, there being 40 feet of effective bench length.

"If," he said, "we split the bench and put it along the wall, then we will have only twenty-four effective feet of bench space and the ends of the two halves will amount to nothing. Then we will have only about 30 feet of floor space convenient to bench surface, while, with the bench amidfloor, there is at least 72 feet of floor space within four feet of the edge of bench surface. I'll keep the big bench," he continued, "and you lads keep the old junk off of it. That will be *your* job!"

The planks at G, under the bench, upon the girts, proved to be very handy indeed for keeping the heavier and larger tools, pipe tongs, pinch bars, etc., and there was talk of flooring over the whole space and using same for placing thereupon engine parts and such auto parts as were in need of bench work. The rack F proved a valuable feature, as upon the pins driven therein were placed hand saws and similar tools, the rack being placed rather low but far enough above shelf E that a man could reach from the far side of the bench and take down a tool hanging upon a pin on the near side of the rack. In addition there are 12 drawers in this bench as shown at H.

An Out-of-the-Way Motor.

This shop, or its repair department, was driven by an electric motor placed upon a stand which raised the motor high above the floor and almost level with the line shaft. Instead of placing the motor upon a shelf or upon a rod-supported floor or platform, it was located on top of a tall stand which was built from the floor almost to the ceiling as shown by Fig. 4 herewith.

This stand was about three feet by two feet and the shelves were all made of doubled one-inch boards gained into the corner posts and fastened therein only by toe-nailing. The shelves were as stated, made of one-inch stuff, two thicknesses being used, the grain crossed and the two thicknesses well fastened together with nails well clinched, the nails being all driven from the top of each shelf and clinched in the bottom surface.

Keeping Track of Things.

This garage, during the past four years, has been under the management of four different managers, the owner, Mr. J. M. Carney, not being able to devote much of his time to the business on account of other matters which claim his attention. Three managers having failed to "deliver the goods," the garage was, about two years ago, placed in charge of Mr. Earl McBride, a registered pharmacist, who, on account of health conditions, was ordered out of sight and reach of his own pills and poison bottles.

During the past two years, Mr. McBride has succeeded in bringing the garage to a fine condition of profitable usefulness and has introduced a number of ingenious methods of business getting—and keeping. In the accounting between the customer and the shop, blanks have been worked out and put into use which not only act as a check between customer and garage, but which enable adequate and just charges to be made for service and repairs rendered, together with the itemized cost of each operation, thereby preventing many a "kick" from the customer and many an under-charge or neglect to charge at all by the garage management.

What To Do and What Was Done.

"Many times," remarked Mr. McBride, "cars come into the garage with verbal orders to do this, that and another thing, but when the car is stripped the workmen find other things which should be done for the good of

Digitized by Google

the car. Some cars are brought to us with orders to 'do what is necessary' and when we find a whole lot of unexpected things, the owner sometimes feels peeved and thinks we have charged him too much.

"Again, a car will be brought in with orders to do certain things only. Then when the work is finished and other things are found necessary by the owner, he is apt to 'jack us up' for not doing the 'other' things unexpectedly found necessary, but which have not been 'ordered' by the owner. In order to keep clear of both horns of the dilemma, the shop cards shown by Fig. 5 were designed and put into use and today not a job, no matter how small or trivial, comes into the shop without carrying with it a card as shown by Fig. 5."

The Shop Card.

As explained by Mr. McBride, the cards had been used singly, one being filled out and attached to each car as it passed the office. But it was stated that the single card was being replaced by a triplicate form, each being upon a different colored paper and the two topmost cards being made with carbon backs so that a single writing upon the topmost card—thick paper rather than card—would fill out the three slips just alike. Then one of the slips would be given to the owner or driver of the car, one sent to the shop with the car and the third slip or card sent to the office of the garage.

It will be noted that the slip is numbered, the one shown in Fig. 5 being No. 336. All the sets of slips will be likewise numbered in rotation and care is taken to use them in rotation, too. When a car comes in with certain things ordered, the things ordered are checked off in the narrow space at the left. These things are noted if specified, even when the order is to "fix everything."

As the car goes through the shop other things found necessary are checked off as attended to, so that a comparison with the owner's slip or the one in the office,

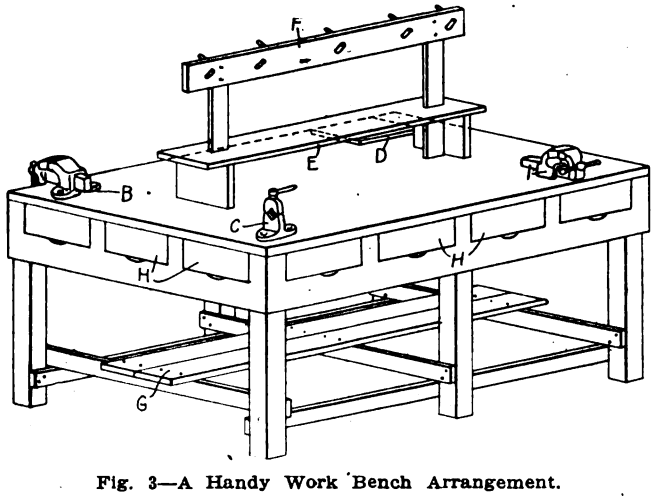

Fig. 3—A Handy Work Bench Arrangement.

with the shop slip, will show exactly what was mentioned as the car came in, also what was found and done later.

Mr. McBride stated that even the old form of single card saved a whole lot of friction and misunderstanding with car owners, for when certain things only were ordered he had required a second card to be filled out exactly like the shop card, and the second card given to the man who brought the car for repairs. The new triplicate slips saved the extra work of making another card and also made each of the three sheets a "law-proof original entry."

Each workman was required—and the requirement insisted upon—to keep accurate account of the time spent upon each of the items checked, and to make the entry for each item at the time the work was done, not afterwards when half the items and the time spent with them had been forgotten!

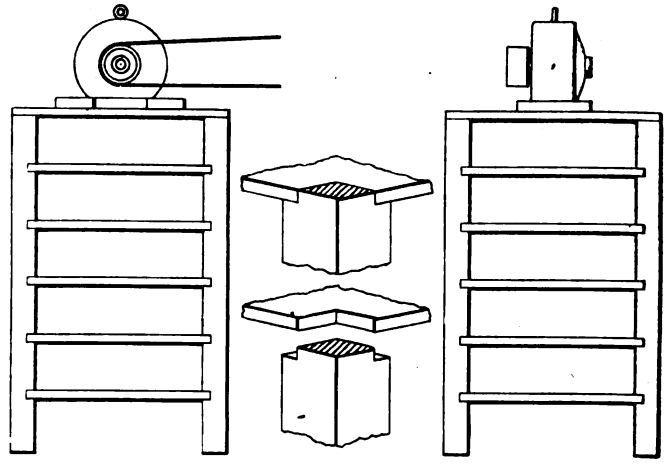

Fig. 4—The Motor Stand.

Methods of Getting New Business.

Mr. McBride obtained new business in an original and highly effective manner. He was a great believer in the personal letter as a business-getter but he stated to the writer that nine-tenths of the advertising literature which he received went into the waste-basket almost unopened and quite unread unless he knew something of the advertiser and of his offerings.

"I tried writing letters to automobile owners around the country," said Mr. McBride, "and I never got business enough in return to pay the postage. Then I worked the personal letters differently. I would slip away as I got a chance to one of the neighboring towns and stay there a few days or a week, according to the size of the place. It did not take long to meet up with most all of the automobile owners in the town and I made it my way to talk with them all and to tell where I was located and what I could do especially in regard to tires and batteries.

"About a month after my visit, having at that time found out pretty well what each automobile stood mostly in need of, I would write a personal letter to each of the men I had seen and talked with, tell them what I could do for them, and invite them to call and use my garage for their convenience when in town. These letters, I found, were read, and I can trace to that method at least $100.00 per month of new and permanent business which

Digitized by Google

the 'personally conducted' letters have brought to the garage.

The Right Kind of a Card.

"When I visited the car owners," continued Mr. McBride, "I handed each man my card which bore the reading:

LINCOLN TRAIL GARAGE.

Battery Service Station. Batteries Rebuilt, Repaired and Recharged. Automobile Repairing, Tire Vulcanizing, Blow-outs, Rim Cuts and Punctures Repaired. All kinds of Tire Work.

FLORA, ILLINOIS.

And I found to my surprise that I could hardly get a hearing with that card. Every man looked at it but took no interest at all in me or in the matters to which

Fig. 5—The Shop Order Blank.

the card related. After studying over the matter for a while I had some new cards printed. The 'Lincoln Garage' business was dropped off, together with most of the fine print on the new card and which read as follows:

THE TRAIL GARAGE.

We Put More Service Into Your Batteries and Tires.

Flora, Illinois.

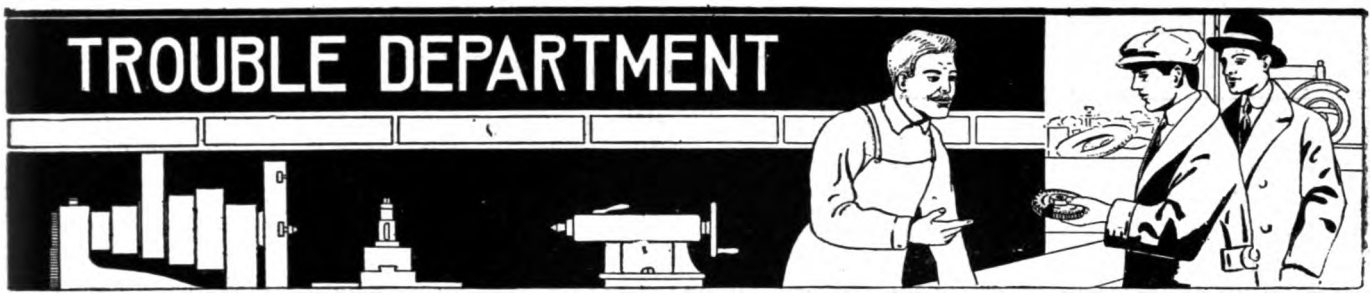
"Well, sir, when I went around a town and handed out those cards to car owners, every man of them was interested and would talk and tell me just what was the matter with their cars and what they would like to have done—'sometime when they could afford it.' In a month or so, after passing out the new cards I would write to the parties I had seen, and lots of them came for work, and they keep coming, too. And some of the men to whom I had given one of the new cards came in for work without even waiting for me to write to them. It sure pays to get up some cards which 'Pull'!"

Welcome to the Garage!

"Another innovation which I started, and to accomplish which I had to overcome numberless objections on the part of the owner, was to keep a man all night and every night in the garage whose business it was to make welcome any car driver who might make a belated arrival. To play host to such and to do everything possible for the comfort and convenience of such 'fly by night' birds of passage."

This man did no repairing or other work save to sell gasoline and oils as required, but he would call a mechanic upon request if necessary.

The man engaged for this position was a retired automobile mechanic who was too old for active work but who had all the "know-how" pertaining to the business and who was very glad to stay all night, seven nights a week in the garage at a very low figure. Thus the garage was never closed and an extra amount of business was secured which made the objecting owner "sit up and take notice" of it!



KEEP THE WINDOWS AND FIXTURES CLEAN.

FOR cleaning windows and mirrors there are several proprietary articles on the market, but a little soda or kerosene and a little thin starch put over the glass and allowed to dry will give excellent results when rubbed off and polished with a newspaper or cloth that leaves no lint. In very cold weather a little alcohol on a cloth is effectual.

Into a one-half pint bottle put two tablespoons whiting and fill the bottle with ammonia; shake well. Take a soft cotton cloth and rub on windows; let stand five minutes, then polish with a flannel cloth and the window will shine.

A solution of alcohol containing two per cent of sulphuric acid will thoroughly clean nickel plated fixtures without damage to the article. Let the articles remain in the solution a few seconds, then wash in water a few seconds. Wipe with a cloth saturated with alcohol, or, better yet, lay the article in alcohol to remove the water and dry with a clean cloth. This will clean and polish the dullest looking piece of nickelware in a few moments.

Testing for Compression.

2602

From W. S. Griffin, Iowa.—I have a 1917 Ford car that consumes but little cylinder oil and is in fairly good condition, though it has been run 2,800 miles. I would like to know how to test the compression of this engine. When using an ordinary air gauge, the gauge would show from 25 to 35 pounds as the engine was slowly turned over. If the crank was given a quick pull, the pressure gauge would show approximately 50 pounds. What should be the correct compression? Will you tell me why the engine seems to run faster than it should when the high speed clutch is engaged? It seems to me that the clutch slips. How can this unit be adjusted?

Reply.—In testing engine compression, the gauge should be screwed into the spark plug hole. Any sort of a gauge which gives the pressure in pounds per square inch will answer the purpose. You should be able to obtain about fifty pounds pressure per square inch in each cylinder when the crank is turned.

If the engine is turned slowly and if it should lack compression, the gauge will not show so high a figure and the engine probably will not give its maximum amount of power.

If your engine seems to run faster than it should when the high speed clutch is engaged, it shows that the high speed clutch adjustment or the spring is not tight enough, and the clutch plates slip.

If you will remove the cover of the transmission at the extreme rear of the clutch assembly, you will notice three little arms which press down upon the clutch plates. Each of these arms is fitted with a set screw and the set screw held in place by a pin. Remove the pin in each set screw and give the screw one-half of a turn. Do not give one of the screws a greater number of turns than the others. The easiest way to make this adjustment is to remove the whole top of the transmission.

Generator on Grant Car.

2603

From A. R. McClune, Pennsylvania.—Is there any way that I can operate my Grant 6 car without a storage battery? Is it possible for me to install a set of dry batteries in place of the storage battery while the storage battery is being charged?

Reply.—We would not advise you to operate this machine without a storage battery. There is great danger that the generator will be burned out if you do this, nor is there any dry battery that you can use. Dry batteries are not intended for this sort of work, and cannot be used. We should advise you to hire a storage battery while yours is off the car.

2604 Installing Oversize Pistons.

From F. F. Blood, New York.—Will you kindly give me directions for installing oversize pistons in a Ford engine?

Reply.—Before installing oversize pistons, each of the cylinders should be measured. Make a series of measurements, in fact, to determine whether or not the cylinders have been worn egg-shaped. If you find that they are out of shape, you should have the cylinders rebored or reground.

If, on the other hand, the cylinders are round, install a set of oversize pistons. We cannot tell you what size pistons to use because this all depends upon the amount of wear in the cylinder. For a Ford engine the piston should be four one-thousandths of an inch smaller in diameter than the inside of the cylinder. Before you install the oversize pistons, however, you should investigate the special leak-proof rings that are now on the market. Very frequently a set of leak-proof rings are the means of saving the cost of oversize pistons.

It is very possible that you will be able to use the same connecting rods that you use at present. In purchasing the manifold is of a wrong shape or in other words a faulty casting.

Perhaps a new manifold will answer the question. Doubtless you can find some garageman who will be willing to let you try another manifold or another carburetor.

Editor's Note.—After sending the above advice to our subscriber, we received a letter which confirmed our diagnosis of his trouble. Both of the carburetors which he had tried were at fault. He installed a good carburetor correctly adjusted, and the engine now gives satisfaction.

2605 Charging Battery at Low Engine Speeds.

From M. W. K., Pennsylvania.—I have an Overland car, model 85, which is equipped with an Autolite generator. This generator starts to charge the battery at a car speed of approximately 14 miles per hour, and the current increases to 12 amperes at about 25 miles per

Digitized by Google

hour. Is it possible to adjust the generator and obtain a charge at a mileage of from 6 to 7 miles per hour? I do not operate my car at speeds much above 12 miles per hour and the battery is exhausted in a few weeks.

Reply.—There is only one way that you can obtain battery charge at a lower car speed. That is to drive the generator shaft at a higher speed. We doubt if this change can be made without considerable machine work.

The gear on the end of the generator shaft will have to be slightly smaller, and the driving gear meshing with it slightly larger. We would suggest that you see a good machinist relative to this change. You may be able to obtain a set of gears which will work out all right. Your generator shaft should run at a speed not quite twice as fast as it does now. The machinist will be able to figure the number of teeth for you.

Any Autolite service station man should be able to adjust the current cutout so that the battery will begin to charge at approximately ten miles per hour car speed instead of fourteen. There is no way to make this adjustment for a lower speed, however, as far as we know.

Ignition Trouble.

2606

From H. K. Bentz, Pennsylvania.—I own a 1912 Overland car, model 59-T, which is fitted with a Splitdorf magneto and Schebler carburetor and lately we have been having trouble with this machine. Considerable effort is necessary to start the engine, which will run for half a minute or so, then stop, no matter what is done to the throttle or the spark lever. At the present time I have an air friction carburetor installed in place of the Schebler, but the results are the same. I have gone all over the gasoline line and am sure that the carburetor is receiving fuel. I have installed a new set of leak-proof rings and a new set of spark plugs. When the motor is cranked by hand the spark at the plug seems to be weak. Do you think that the trouble is in the magneto or in the coil?

Reply.—From your description of your trouble, we are very much inclined to think that the lack of power is due to poor ignition. As we understand you, at the present time you have a new carburetor on the machine, of modern design and which has been giving satisfaction throughout the country.

If you are sure that there are no leaks in the intake system, it is safe to assume that the magneto is to blame. We would suggest, however, that you make a careful examination of the engine. Be sure that there are no leaks at any of the joints in the system; be sure that the valve stems fit the valve guides tightly; and that the spark plugs are screwed tightly into the cylinders; also that there is no loss of compression.

Having made sure that there are no troubles of this sort, examine the magneto. Mark the magneto coupling or the magneto gears in such a way that you can return it to its place without changing the timing of the engine. Then remove the magneto. You can do this without disturbing any of the wiring. Unscrew the plugs and place them on the tops of the cylinders.

Give the magneto shaft a twirl with your hand and see if there is a spark at each plug. Then remove one of the wires leading to one of the plugs and hold it about one-eighth of an inch away from the cylinder head. The the oversize pistons, try to get them to fit your connecting rods. This will save the trouble of scraping all of the bearings.

In fitting rings to the cylinders, coat the cylinders inside with Prussian blue and slip the ring into place. The high spots on the ring will scrape off the blue. File off these high spots and repeat the operation until the ring contacts with the cylinders all the way around. Adjust the ring clearance last.

It is important that all four pistons have practically the same weight.

Ammeter on Oakland Car.

2607

From F. M. B., Illinois.—Will you kindly furnish me with instructions for wiring an ammeter in the circuit of an Oakland six cylinder model 32 car? Is there any general rule for installing ammeters upon cars?

Reply.—The ammeter is connected in the line between the starting switch and the combination lighting and ignition switch on the dash. As a general rule, you can count upon installing an ammeter on any car in the same way, providing the car is fitted with a single wire system. Practically all of the current from the generator must pass through the wire which leads from the starting switch to the ignition or lighting switch.

When installing ammeters in any car, trace the wire leading from the storage battery to the starting switch and thence to the starting motor. Then, "hands off" from this wire.

Find some small wire connection along this line which leads to a common connection on the dashboard. Cut this wire and insert the ammeter. Always bear in mind *not* to insert an ammeter in any line which originally was wired with cable larger than No. 14 gauge.

The above rules apply to practically all systems except the early Delco apparatus.

An Auxiliary Circulator.

2608

From H. R. Miller, Ohio.—I own a model 490 Chevrolet car which is giving me trouble by overheating. Would you advise me to install a water circulator similar to those used on Ford cars on this engine? How may the frame members of this car be reinforced?

Reply.—If you have trouble by your engine overheating we would strongly recommend that you use a water circulator such as you suggest similar to that designed for the Ford car, that is providing the fitting is of the same

Digitized by Google

size as that used on the Ford. We have no records in this office which would enable us to verify the fact.

Whether it will prevent your car from overheating we cannot say. It undoubtedly will help a great deal. Water in circulation does not overheat readily, whereas water in thermo-syphon system will overheat very quickly if the amount of heat in the cylinders is at all excessive. This is particularly true when the car is slanted as it would be in traveling uphill.

The rear end of the frame can be strengthened by inserting oak strips between the flanges of the channel iron section. This is the cheapest and simplest method you can use. If you desire to reinforce the cross members, use regular channel iron such as may be obtained at any building construction supply house.

2609 **Probably a Damaged Fly-Wheel.**

From Mr. J. B. Fassitt, Maryland.—I have a 1918 Mitchell car, model 40. In traveling over a stone culvert, a projecting rock hit the flywheel and since that time there has been a knock in the engine which does not seem to interfere with the engine action. I have driven this car about 1,500 miles since the accident and have noticed that the knock disappears at times. This same engine seems to skip in two cylinders at low speeds, but at speeds of approximately 30 miles per hour or over, it operates satisfactorily. I have had the valves ground and the carbon removed, but the trouble still remains.

Reply.—Your trouble with your Mitchell car may be due to the fact that you have strained the flywheel, or broken off one or more of the flywheel studs.

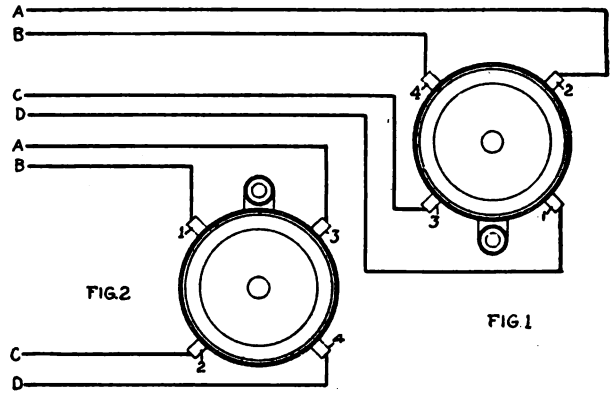
We should advise you to take down the engine and examine this unit. It will be best for you to remove the crankshaft and center it. Be sure that it is not bent and be sure that all of the main bearings are solid. It is very possible that one of the main bearing housings has been cracked. Do not run your car until you have located the trouble.

The skip in the cylinders is probably due to air leakage around the valve stems or in the manifold, or manifold joints. Probably the whole engine was badly strained when the flywheel hit the rock.

2610 **Repairing Broken Water Jacket.**

From Thos. Seay, Texas.—I have a Brush car, the water jacket of which is cracked, due to frozen water. Is there any way to repair this?

A small crack in the cylinders may be repaired by the use of copper sulphate. This chemical is in crystal form and is sometimes called "blue vitriol" or "blue stone."



In using it dissolve as much as you can in one quart of warm water. Remove the cylinder and pour the liquid into the jacket. At first it will probably leak through the crack. Turn the cylinder in such a position so that it will. Catch the liquid in a glass dish and return it to the cylinder. After a short time the crack will be filled with a deposit of copper.

If you find that you are unable to repair the crack by this method, write to the Solderall Co., 129 Sussex Ave., Newark, N. J., as well as the Peters Engineering Co., 3202 Chestnut St., Philadelphia, Pa. The latter corporation manufacture a solder which will melt at 300 degrees of heat and can be applied with an ordinary painter's blow torch. You may be able to make a repair with this product without removing the cylinder direct from the engine.

2611 **Timer Upside Down.**

From E. V. Dubs, Pennsylvania.—I have a 1917 Ford car which does not seem to work well or give any power, although everything seems to be in good condition; the ignition system is not defective and there is no carbon in the cylinders. The engine does not pick up when I advance the spark but seems to pull much better when the spark lever is retarded.

I am also having trouble with headlight bulbs which

Timer May Be Inverted. Timer Rod Connection Should Come at Top.

burn out very quickly. They will burn brightly for a few minutes and then go out.

Reply.—Your trouble is undoubtedly due to the fact that the timer is installed bottom side up. That is, the timer connection with the spark advance lever is at the bottom rather than at the top as shown by the accompanying diagram. If this is the case, you will have to remove the four timer wires, turn the timer the other side upwards and replace the wires in the same relative positions, but with diffrent posts.

The diagram herewith will show you by comparison just how to make the proper connections. Notice the way the wires are in each diagram and the way they are connected with the posts.

The light bulbs which you are using are not high enough voltage. Purchase lights which are rated two or three volts higher than the ones you have and you will have no trouble.

2612 **Fitting Piston Rings.**

From Wm. A. Leas, Ohio.—I have a Buick model B-25 car 1914 model. The engine has very poor com-

Digitized by Google

pression despite the fact that I recently installed a set of piston rings. I was careful not to leave any space between the ends of the rings to prevent any chance for leakage.

There is a knock in the engine which seems to be in the third cylinder. Can you suggest the possible trouble?

If the car is equipped with oversize tires 33x4, will it give less power than with 32x3½ tires?

Reply.—You probably did not install the piston rings properly. In installing a piston ring, you should be careful to fit each ring to the cylinder in which it is to be applied. The cylinder should be coated with Prussian blue, and the ring slipped into place upon a wooden dummy piston. The Prussian blue will wipe off upon the high spots of the ring. These high spots should be scraped off with fine emery cloth. The operation should be repeated until the ring contacts with the cylinders all the way around.

Be sure that the cylinders are not egg-shaped and be sure that they are not scratched or scored. If the piston rings are tight in the cylinders, it is very improbable that the pistons will knock. The pistons should be .004 smaller in diameter than the rings.

You should leave the clearance between the ends of the piston ring about the thickness of a piece of newspaper. You must do this or there is great danger of spoiling your engine. Do not be afraid that the gas will leak through these tiny places. It will not, if you space the rings so that the joints in the rings come at opposite points on the piston.

The knock of which you complain is probably due to a loose bearing, or it is possible that the crankshaft is not properly aligned? Without further details we can help you but little.

When a car is equipped with 32 inch tires it will give slightly more power than if oversize tires are applied. The difference is so very small, however, that it is not noticeable.

Leak in Intake Line.

2613

From F. L. Eicholtz, Illinois.—I have a 1916 car which has been run about 3,000 miles. The engine does not give satisfaction, in that it will not operate upon all four cylinders all of the time. It will not idle properly and requires constant readjustment of needle valve for different speeds. If the throttle is opened slowly, the engine will load up with gas at times, and at other times will backfire through the carburetor.

At a speed of 35 miles per hour, however, it seems to operate and give full power, but if the throttle is closed and opened again the gasoline must be readjusted before it will fire upon all four cylinders. The engine will not accelerate nor throttle smoothly, even after it is well heated. The valves have recently been ground and the magneto examined and the plugs are in good condition. I have tried two carburetors, but the trouble still persists.

Reply.—In the first place, it would seem that all of your trouble is caused by leak or leaks in the intake line at some point between the valves and the carburetor.

Remove the manifold and put in new gaskets, coating the gaskets well with orange shellac. See that the valve stems fit the guides properly. Only a short time ago one of our subscribers had practically the same trouble. He claimed that he had just put in new valve guides, but the writer of this letter inspected his car, and found that eight out of twelve of the guides were loose upon the stems. A leak of the sort we mention can be located very easily by squirting gasoline at various points on the engine and noting the effect upon the engine action. Try to borrow another carburetor which has a larger inlet connection. It is possible that both the carburetors you tried were at fault.

Clean the exhaust line, and be sure that no back pressure is formed. If the trouble still persists, evidently it is due to faulty engine design. It may be that magneto should generate enough current to leap across a one-eighth of an inch gap. The spark should be white and hot. If it is not, the magneto is at fault.

Remove the distributor cover and clean the distributor brush and the segments. Wipe off all of the grease, oil and dust from between the magnets and from the exterior parts of the machine. Examine the breaker points and see that they are smooth and flat, and that they contact their whole face when they are together. If they are pitted, or if they do not touch together properly, new ones should be put in their place. When the breaker arm is riding on the top of the cam, the breaker points should be separated not more than .25 of an inch.

If, after having followed these directions, the magneto does not generate sufficient current, we should advise you to return it to the service station or the factory for repairs. There is no way of telling whether the trouble is in the coil or in the magneto except by a series of experiments. Only the service station expert or the factory can tell you what the trouble is.

Not Universal Joint Trouble.

2614

From Walter H. Croft, Illinois.—I have a Buick little 6 car, 1917 model, which has a jerky action when traveling at a speed of less than eight miles an hour. My garageman says that this action is caused by lost motion in the universal joint, but so far has been unable to remedy the trouble.

What do you think about it?

Reply.—According to your description we are inclined to think that your trouble is in the engine, not the universal joint. As a matter of fact, we cannot see any reason why a universal joint would cause such an action no matter how much lost motion there was in it, unless of course you kept speeding up the engine and slowing it down rapidly. As long as the engine is pulling straight

Digitized by Google

ahead the universal joint is twisted as far forward as it will go.

You can verify this fact by running the car at a low rate of speed up a small incline. You will probably find that the jerky action is noticeable just as much as when the car is operated on level ground. Your trouble is either caused by poor carburetor adjustment or leaks in the intake line. Be sure that the spark plugs are all tight and be sure that the guides around the valve stems are tight. Remove the manifold and use a set of new gaskets together with plenty of orange shellac in replacing them. All joints between the carburetor and the explosion chamber must be tight, or the engine will not pull properly. Try to borrow another carburetor from the garage man and see if your trouble ceases with the installation of the new carburetor.

If, after having followed all the above directions you still have trouble, examine the ignition system. It is very possible that there is a loose or grounded wire at some point in the system. If you still have trouble let us hear from you again, and we will advise you further.

2615 Lack of Power in Maxwell.

From H. E. Whisker, Pennsylvania.—I would like to know why my 1918 Maxwell car which is geared four to one does not have the pulling power that it did when I first purchased it. I have examined the engine and there does not seem to be much carbon in the cylinders.

Kindly give me any information that you can relative to loss of power.

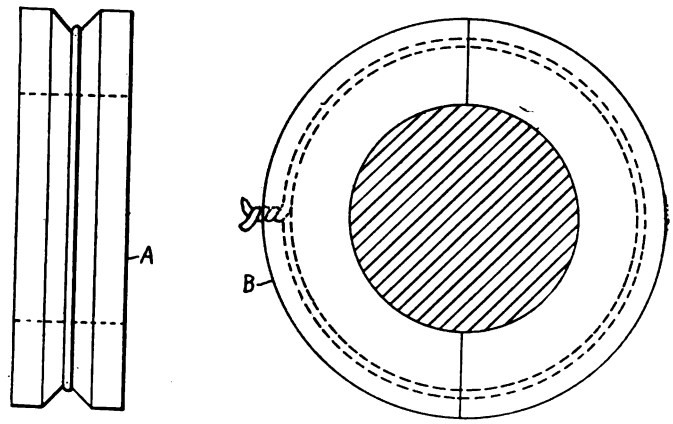
Reply.—In the first place, we would suggest that you make a series of experiments to determine whether the trouble is in the ignition system or in the gas system. Remove all of the plugs and place them upon the top of the cylinders, leaving them connected with their secondary wire which connects the coil with the center of the Atwater-Kent distributor. Hold this secondary wire 3/16 of an inch away from the cylinder head while somebody cranks the engine.

If the ignition system is in good condition, you should obtain a fat, hot spark between this wire and the cylinder head. Do not separate the wire from the cylinder head more than 3/16 of an inch nor do not turn the engine over without leaving a path for the secondary wire, either through the plugs or through this wire to the head. You will probably find that the ignition system is all right. If you cannot get a 3/16 inch spark, write us again.

Our opinion is that your trouble is in the gas system. You claim that the compression is good. Compare the compression with that of another car of the same year. The compresion should be at least 60 lbs. per square inch. If it is not, you have located your trouble. See if you can obtain more power by disconnecting the hot air carburetor connection. After the engine is started you will get considerable more power by using cold air through the carburetor. Try to cut down on the gasoline.

From what you say, it would seem that too much gasoline is being used, or not enough air.

It is possible that the choker valve is not fully open. Examine the intake line between the carburetor and the engine. Be sure that there are no leaks in it. Pay particular attention to the bushings around the valve stems. If it is possible, we would suggest that you borrow a carburetor of another make and try it out.



Make a series of notes of your different experiments, and let us hear from you again.

2616 Main Shaft End Play.

From C. E. Davis, Virginia.—I have a 1915 Ford car which has recently been overhauled but there is quite a little end play in the crank shaft, about 1/16 inch in all. This seems to cause trouble in the magneto since that unit will not generate current enough to start the engine. Is there any way for me to apply a washer to the crank shaft, without removing the whole engine from the car?

Reply.—There are two methods whereby you can take up the end play in the crank shaft. This end play is usually prevented by the width of the main bearings, that is, they are fitted to the journals so that the shaft cannot move backward and forward through them. You can replace one or more of the main bearing caps to compensate for this end play.

There is another and easier way to accomplish a result, however. That is to insert a split washer between the main bearing and the flywheel flange. As a matter of fact it would be practical to insert a washer behind any of the three main bearings. After the split washer has been fitted carefully so that it will not bind upon the shaft, cut a groove all the way around the circumference about one-eighth of an inch deep, put the washer in place, and in this groove tie a piece of fine steel wire. Twist the wire around three or four times, tying it each time. The sketch accompanying shows just how the washer can be tied in place.

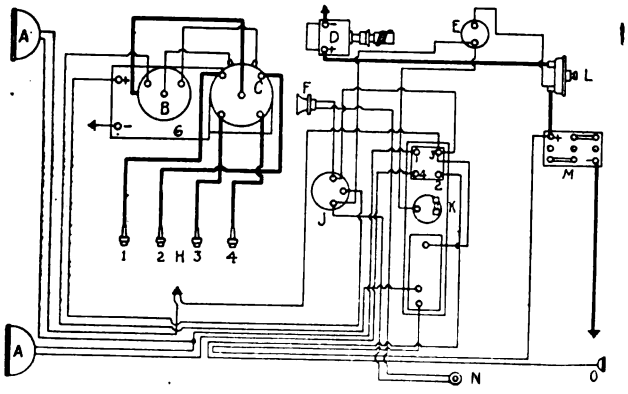
How the Repair or Trust Washer Can Be Made and Applied Without Disturbing Crank Shaft.

The steel magnets in the magneto should have a clearance the thickness of a postcard from the electro magnets.

Digitized by Google

2617 **Degrees in a Circle.**

From J. L. Smith, Ohio.—Will you please tell me how the degrees in a circle correspond with the minutes on a clock face?



Reply.—Every time the minute hand of a clock moves one minute it has moved six degrees. When the minute hand is moved to quarter past the hour, then it has moved 90 degrees, or just a right angle. A circle is divided into 360 degrees. A right angle is 90 degrees. When the minute hand shows half past the hour it is just 180 degrees past twelve o'clock. You will notice that when we speak of degrees in the Automobile Dealer and Repairer magazine as applied to valve opening, we say, for instance, that an exhaust valve opens 45 degrees before bottom center.

This would mean that if a pointer were attached to the crankshaft, and the piston were brought to the top of its stroke, so that the pointer would be at twelve o'clock, the pointer would have to move downward until it was between seven and eight minutes before half past.

In other words, the exhaust valve would open 22½ minutes past the hour, and at half past the hour the piston would reach bottom center, or the lowest point of its stroke.

2618 **Wiring of Chevrolet 1918 Car.**

From an Alabama Subscriber.—Will you kindly give me a wiring diagram of the 1918 Chevrolet car?

Wiring of Chevrolet Car.

Reply.—Wiring diagram is given herewith.

2619 **1915 Briscoe Valve Timing.**

From H. Aubinoe, D. C.—Will you kindly give me the valve timing on a Briscoe 1915 three passenger clover leaf roadster car?

Reply.—The exhaust valve on the 1915 Briscoe car should open 47 degrees before bottom center. In order to check this figure you will notice that the exhaust valve closes five degrees after top center, and the intake opens at dead top center; and the inlet closes 45 degrees past bottom center. This covers Model A machine.

2620 **Legal Questions.**

From P. Pearson, Minnesota.—Will you kindly give me some advice on the following legal questions?

(1) Must a car owner have a chauffeur's license to use his car for livery purposes?

(2) If I hire a driver must he have a license?

(3) How does the law apply to garages that run livery in connection?

(4) How is the Minnesota Lien Law regarding the filing of a mechanic's lien? Before how many days must you apply same?

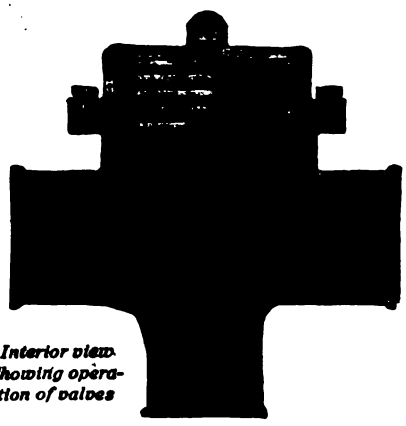
(5) Is the Anti-Glare Law a State law or is it local?

Answer.—(1) Under the laws of Minnesota any person (including owners) who drives a motor vehicle for hire must have a "chauffeur's license." This license is issued by the Secretary of State only after due application is made to him, and after the applicant has satisfactorily passed an examination as to his "knowledge of the construction, mechanism and operation" of automobiles. The fee is $2.00 and the license must be renewed every calendar year. The applicant must be over 18 years of age.

(2) If you hire a driver he must certainly have a "chauffeur's license."

(3) The same ruling applies to garages run in conjunction with livery stables.

(4) A mechanic's lien, sworn to by the lienor, must be filed in the proper register's office within 90 days after the last item of work or materials has been performed or furnished on the job. An action to foreclose the lien must be started within the year, and in case the property is sold on foreclosure, the owner has one year within which to redeem it upon paying all costs and expenses to date of redemption.



(5) We can find no state statute regarding "anti-glare." It is probably controlled by local ordinances. If you will inquire of any police officer, you can probably learn all about it.

2621 **Too Late.**

From W. W. G., Pennsylvania.—I wish that you would give me some legal advice on the following case:

A owns a garage building and all the equipment, that is, all the tools in it, and A sells this equipment to B and B rents garage building and operates a service station there, and C has an agency for a car and a truck attachment but C has no service station and B asks C for his service work on the cars and coupling up these attachments, and C gives it to B, and B asks C to put in some supplies for these cars and attachments and C puts in some supplies and during the time B has been doing C's work B asks C to buy some of his equipment, that is, some of the tools, as he needed a little cash, and C buys and gets a receipt for the number of articles bought and amount paid for them and C agrees to let B use these tools as long as B does C's work. And then

Interior view. Showing operation of valves

For cold weather gasoline economy you will see the real value in the

Rayfield Motor Thermostat

Every motor wastes gasoline until the cooling water is heated to 170°. The driver without a Thermostat must keep on the "choker" until three to five gallons of water are heated to 170°. The waste of fuel is considerable.

How It Works

With the Rayfield Motor Thermostat, there is no circulation of cold water around the engine. The pump circulates the cold water from radiator through a by-pass without disturbing water surrounding the cylinders.

When the water around the cylinders is heated to 170°, Rayfield Thermostat gradually opens—permitting pump circulation to enter motor block.

In the Thermosyphon system, the same action takes place except that no by-pass is required and no circulation of water occurs until Thermostat opens.

Summer Smoothness

The effects of the Rayfield Motor Thermostat are immediately apparent to the driver. Instead of having a spitting carburetor and a missing motor for ten to fifteen minutes on a cold morning, the engine is running with summer smoothness within two or three minutes.

When the car is standing, the Thermostat closes as soon as water temperature is reduced to 170°. Thus the water around the motor remains warm longer.

For Thermosyphon systems, the price, including all fittings, is $15.00. For pump circulation systems, the price, including all fittings, $17.50. Installation is simple. Garages and dealers handle it.

For maximum efficiency the

RAYFIELD CARBURETOR

—on which we have resumed production, quality and deliveries as of old.

The correct Rayfield secures not only marked gasoline economy, but will put new pep and life into the motor.

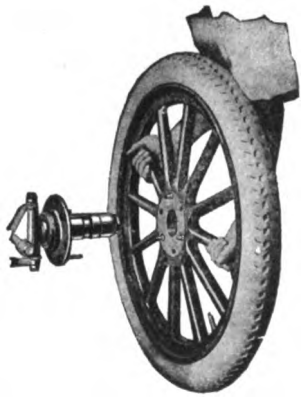
along comes A, the landlord, and issues a landlord's warranty of distress, and that is for rent B owes A. Are all C's articles, tools and supplies subject to A's levy, and can constable sell C's supplies and tools if C serves a notice on constable ten (10) days before the sale on the day constable puts up his sale bill. Now I am C in this case and I don't like to lose this stuff.

Reply.—You are in an unfortunate predicament and need a competent lawyer to extricate you if it is possible to do so. I believe that in Pennsylvania a landlord can seize upon goods of a stranger found upon the premises unless exempted by some rule of law. Whether you are within the exemption requires investigation and consultation. This is another case of "locking the door after the horse is stolen." In the future bear in mind that $10 worth of advice before you enter into business relations with another person is worth more than $100 of fees after the damage is done. Ignorance of the law excuses no man.

NEW AND INTERESTING THINGS IN MOTORDOM

Johns-Manville Fire Extinguisher.



Every automobilist realizes that no matter how fully his car is protected by insurance, he can never actually replace the machine without a loss, and so it devolves upon him to protect himself with some sort of fire extinguisher.

The garageman realizes that he is responsible for the cars in his garage, whether they belong to him or not, and he, too, should see that the garage is adequately protected. Water is not a good gasoline fire extinguisher.

There is a fire extinguisher on the market, however, which will extinguish gasoline fires. This device is sold by H. W. Johns-Manville Co. of New York City, and can be obtained at practically any accessory store. The device has many novel features. It is used in the same manner as an ordinary air pump. Pressure can be pumped into the tank and the stream controlled from beneath by a special lever. A chemical is used in the device which the manufacturers claim will not corrode metals, will not freeze, and will not damage the finest fabrics.

E-Z-Way Outfit.

Every Ford owner who desires to bring his machine up-to-date, should investigate the E-Z-Way demountable wheel outfit which is being manufactured by C. A. Schwartzman, 2610 Atlantic Avenue, Brooklyn, N. Y. This outfit is used in conjunction with the regular Ford wheels, thus saving the cost of new ones. The regular Ford hubs are removed and two special

E-Z-Way Demountable Wheel.

flanges applied. An E-Z-Way hub is placed upon the spindle or axle.

This installation having been made, all of the wheels are interchangeable. To remove the wheels, one need but unscrew three nuts. Then the wheel may be taken from the fitting and replaced with a spare wheel which is furnished with the outfit. Aside from the fact that time can be saved in road repairs, there is another outstanding feature.

With the outfit there is no danger of getting the bearings dirty while making the change. The cost of the whole outfit is little more than the cost of a single Ford wheel. The E-Z-Way outfit can be obtained for use on Ford delivery cars or trucks.

Fred D. Williams Now General Manager of the L. H. Gilmer Company.

Mr. Fred D. Williams, formerly head of the Power Specialties Department of the H. W. Johns-Manville Co., who associated himself with the L. H. Gilmer Co. of Philadelphia as assistant general manager on April 29th last, has now been appointed general manager.

Mr. Williams' promotion is a logical continuation of his previous successes and is particularly appropriate inasmuch as it involves no severance of established trade acquaintances.

The products of the L. H. Gilmer Co., which will now be produced under the management of Mr. Williams, have grown in importance as allies of motordom, until to-day perhaps 90 per cent. of all automobiles and tractors produced in America carry one or more Gilmer products as regular equipment. Gilmer Woven Endless Fan Belts, Woven Webbing, Tape and Straps, Top, Stay, Tire, Curtain and Rebound are all well and favorably known.

The L. H. Gilmer Co. also manufacture a rapidly increasing volume of woven power belting.

Bearing Catalog.

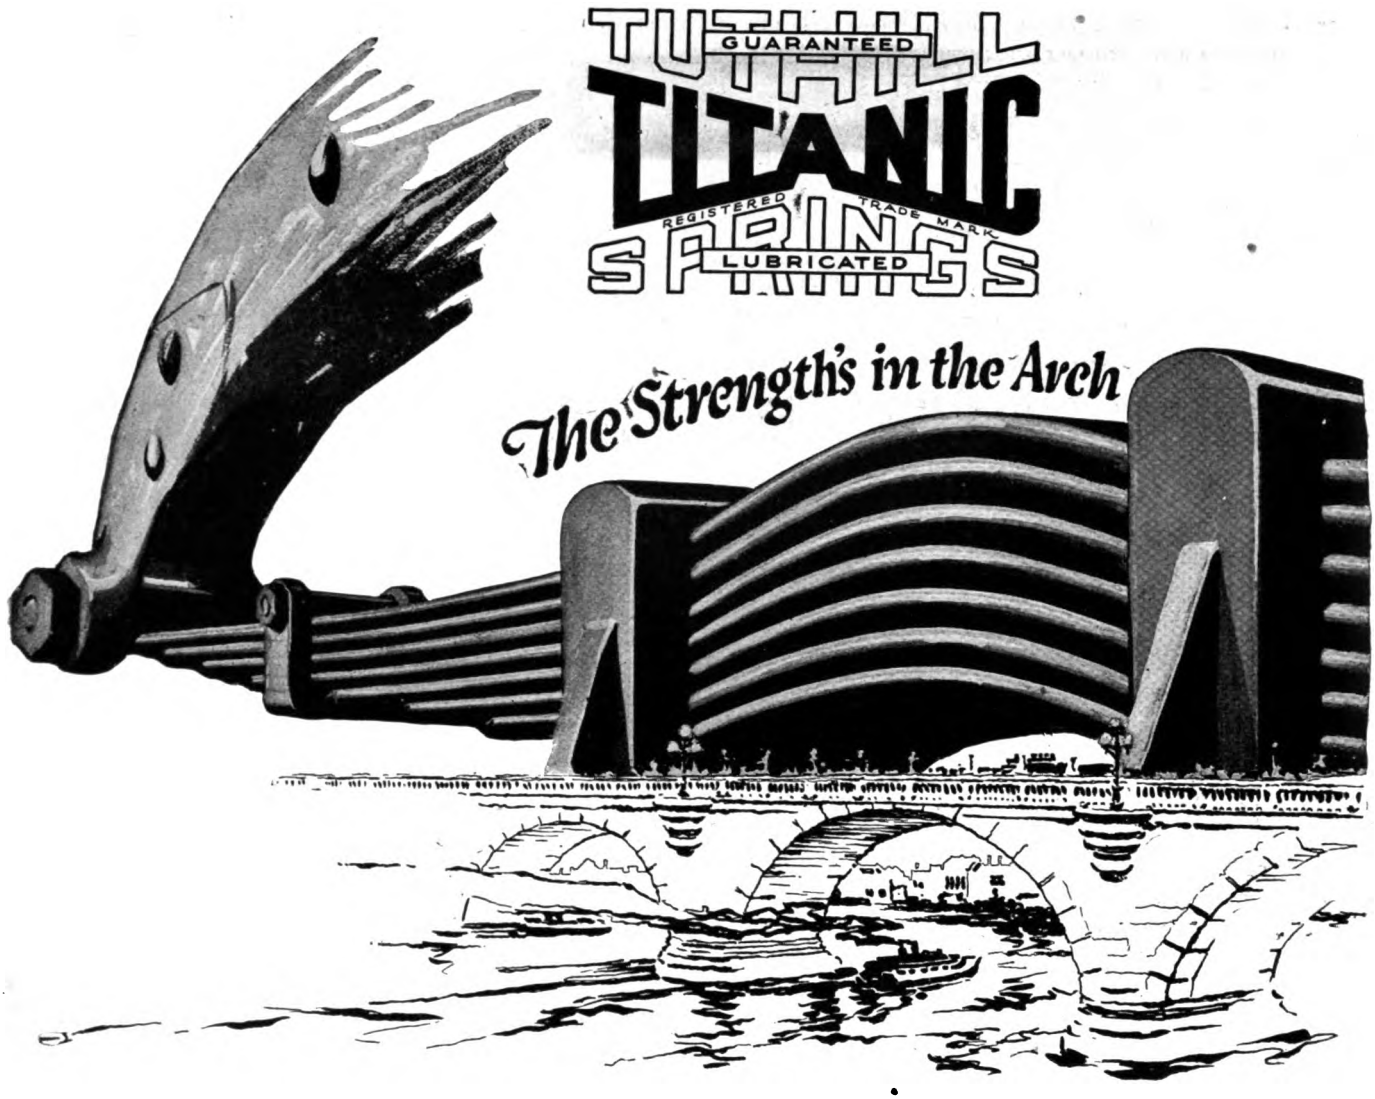
The Gwilliam Co., 254 W. 58th Street, New York City, have just brought out their 1919 bearing catalog which should be in the hands of every repairman in the country, for the very reason that it gives the bearing sizes carried in stock by the above company.

This company manufactures ball bearings of every type including the thrust, cup and cone, annular and double annular, roller bearings of the straight and taper type, as well as special roller thrust bearings.

The whole list comprises bearings for practically any installation. In addition to standard bearings of various sizes, the Gwilliam Co. list in their catalog the standard sizes of steel balls which they carry in stock.

A Dealer's Help.

The Handsome Cut-Out illustrated herewith, in reduced size, is very effective for use in making Window Displays, or for Counter and Show Case Display. It is attractively printed in five colors, 10½ inches by 14 inches in size, with easel back, and the slogan "Every Spark,—a Bark" catches the attention of motor users, and brings them into the store for more information about National Spark Plugs.



The National Spark Plug Display Card.

This new Dealer's Help is now being sent to every National Dealer by the Bergie National Spark Plug Co., Rockford, Ill., and those dealers who have already used it for making Window and Counter Displays have found it a "Silent Salesman" that never fails to attract attention, excite interest and increase the sales of National Spark Plugs. If you are a National dealer don't fail to wirte at once for one of these attractive Cut-Outs to help increase your sales. It is a dealer's help that brings most satisfactory results.

Nathan Novelty Moves to New Location.

The Nathan Novelty Mfg. Co., formerly of 84 Reade Street, New York City, moved to their new factory at the corner of 5th Avenue and 12th Street on February 1st. This change was due to the fact that their business has been growing very steadily and their new factory gives them increased facilities.

Built Like a Bridge to Stand All Shock

AS early as 4,000 B. C. men faced the danger of "center break." The tendency of an arch is to sink in the center. Engineers have had to fight for center strength.

* * * *

Tuthill Titanics are the spring with the ***unbreakable*** center. Guaranteed at all points and in every respect for one year, they are guaranteed ***forever*** against center breakage — where three out of four old style springs break first.

* * * *

Tuthill Titanics are built strongest to wear longest where other springs give way first. A resilient arch of steel meets and absorbs every shock with swift response and sure strength. No center holes or nibs weaken this unbreakable center. There are no bolts to shear off. Patented "wedge" and "yoke" plates hold like a vise.

* * * *

Utmost convenience in spring replacements, the confidence of your customers and steadily increasing sales are yours when you handle these famous springs. There is a guaranteed ***"Titanic" for every make of car.***

* * * *

See "Chilton's" or "Auto Trade Directory" for complete list of Distributors.

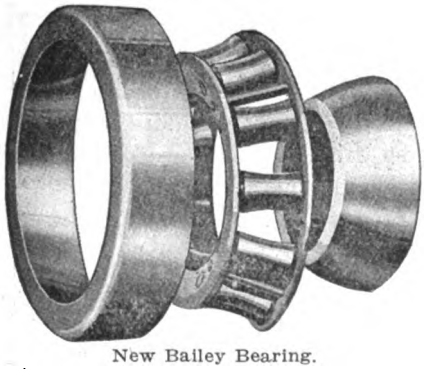
Barnstead Stills.

The attention of our readers is called to the line of stills and sterilizers being manufactured by the Barnstead Still & Sterilizer Co., 2 Lanesville Terrace, Forest Hills, Boston, Mass. This line of stills is very large and the stills may be operated from electric current, gas or kerosene.



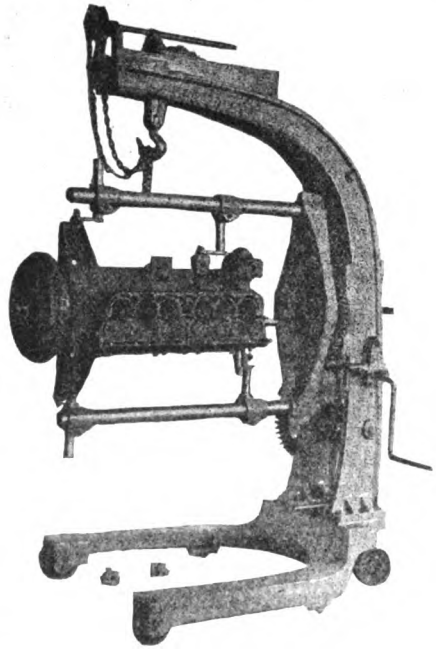
The water is said to contain but one part of mineral matter in a million parts of water. The Edison Storage Battery manufacturers recommend the use of water distilled by this apparatus for their batteries. The cost of operation of the stills is extremely low and it is claimed that the water can be used economically for drinking purposes in the garage.

A Barnstead Still.

A Distinct Departure in Roller Bearings.

Departing from the usual type of roller bearing design the Geo. D. Bailey Co., makers of the Bailey Ball Thrust, have placed on the market a front wheel bearing for Ford and Chevrolet 490's under the name Shafer Roller Bearing that eliminates the chief source of front wheel bearing trouble, namely the inability to take a heavy thrust (sideway) load without damage to the bearing and take care of axle spindle deflection as well.

New Bailey Bearing.



The outer surface of the inner cone is convex, having the contour of a perfect ball, and the rollers possess a concave surface, thereby forming a cradle as it were for the cone and allowing it to swing to meet any deflection of the spindle when same gets out of alignment. The cone being free to move with the spindle and the load being taken upon the full length of the rollers causes no strain or binding of bearing itself as in the case of the rollers of a bearing the cone of which is held perfectly rigid and cannot meet the misalignment or deflection of spindle.

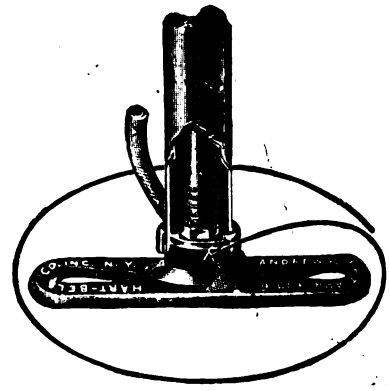
The concave surface of the rollers at all times presents an equal load-carrying surface both from the side as well as the top and therefore the bearing is able to accept thrust (sideway) loads equally as well as radial (downward) loads. This feature in itself is a distinct departure and permanently stops the real source of front wheel bearing trouble.

Moreover, nothing but the highest grade chrome nickel alloy steel is used throughout. This fact coupled with three years of most severe road and breakdown tests enables the makers to guarantee every Shafer bearing without reservations.

Portable Floor Crane and Hoist.

The Canton Foundry & Machine Co., of Canton, Ohio, have just developed a piece of garage equipment which is meeting with the approval of many engineers. The outfit is a combination crane, hoist, truck and complete work bench, designed especially for the handling of engines. The outstanding feature of the device is its flexibility. With it the engine may be removed from the chassis, hooked to the stand, and taken to any part of the machine shop or garage.

Portable Floor Crane and Hoist.



Since the device can be revolved, the engine can be reached easily. The hoist has a capacity of two tons and a lift or clearance of 6 feet 4 inches. The crane is equipped with Hyatt roller bearings and finished by expert workmen. The accompanying illustration will give the reader an idea as to just how the machine appears.

The Hart-Bell Pump.

We illustrate herewith an air pump of novel design, termed the Hart-Bell and manufactured by the Hart-Bell Co., Inc., 1926 Broadway, New York City.

In the base of the pump there is a cone shaped form and the bottom of this cylinder follows the shape of this cone, resulting in a flare. At every stroke the leather bucket on the piston is flared out over this cone to a size larger than the cylinder of the pump, always insuring a tight bucket.

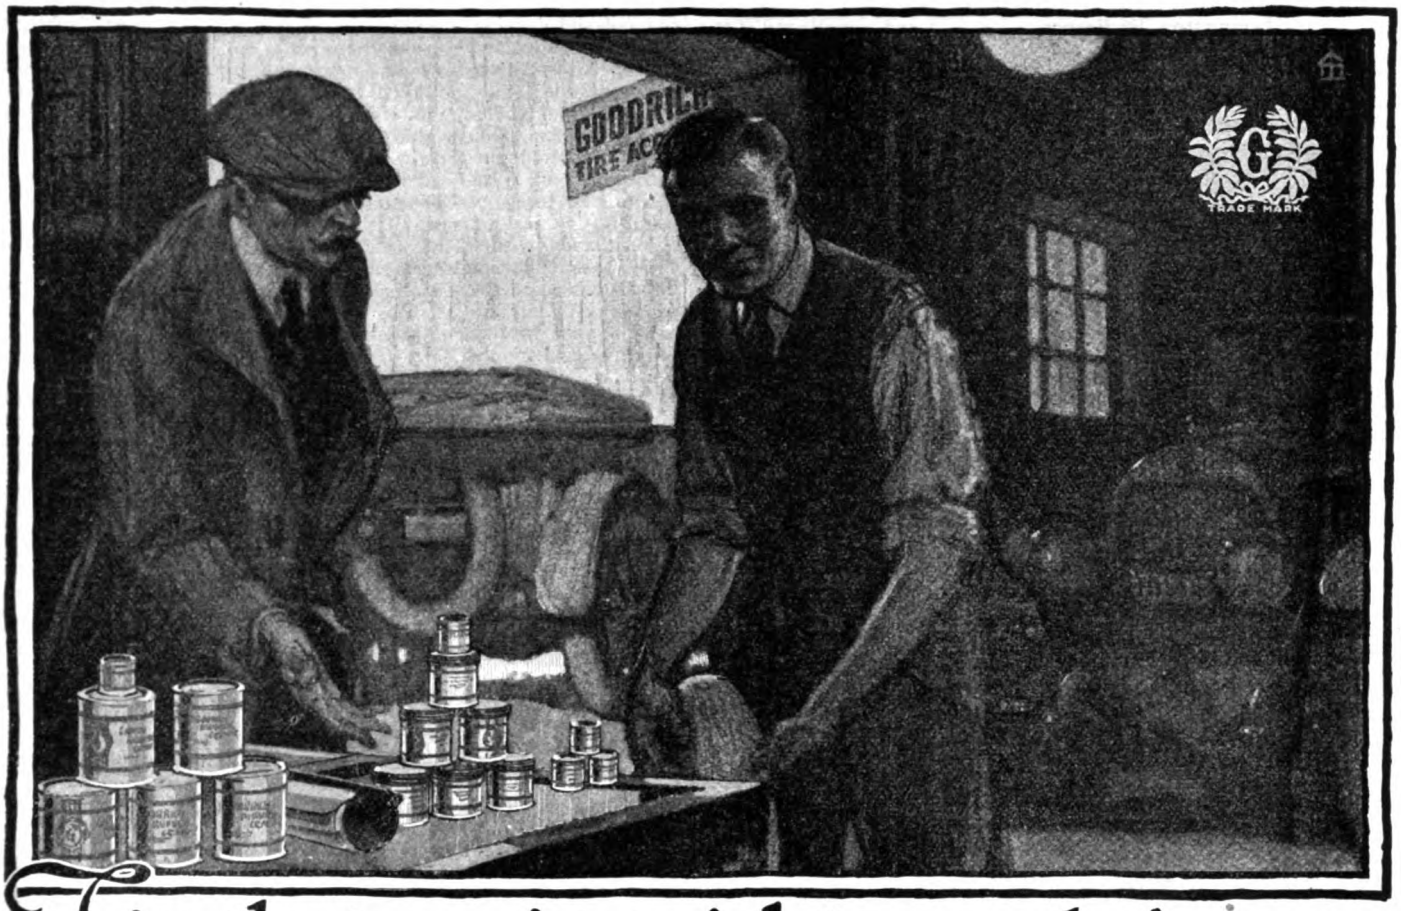
When the pump is not in use the leather bucket is kept in shape due to this construction. In other words, it is very much like a pair of shoes that are kept in shoe trees when not in use to keep them from curling up.

Partial Section of a Hart-Bell Pump, Showing Patented Plunger Bucket.

Will Make New Type Bearings.

The Perfection Roller Bearing Co. has been formed to place on the market new types of roller bearings, among them a non-lubricating bearing, also a bearing to install on badly worn Ford rear axles. C. M. Carr, a former automobile trade publisher, heads the organization as president, and William R. Bullion, formerly with the Elgin Motor Car Co., is secretary.

The company's headquarters are located at 117 N. Dearborn Street, Chicago, and the factory is at Englewood. Mr. Carr states that the new organization will have something distinctive to show the trade by show-time and will exhibit at Milwaukee and Chicago. The company seeks business among the large users of bearings on models designed especially to fit customers' equipment. A catalog line for replacement work will eventually be sold through jobbers to the repair shop and garage trades.



Re-Painting Outfit.

Now that the Spring season is near at hand, the automobilist is working upon his car to put it in condition for the coming season. Doubtless many of our readers do not feel like paying out a great amount of money to have their cars re-painted. As a matter of fact, any car owner can paint his own car very easily and obtain a hard finished paint surface with but little effort.

The F. O. Pierce Co., 12 West Broadway, New York City, manufacture and sell what they choose to term as their "automobile painting system," consisting of three cans of automobile paint, color and finish. They claim that this system of painting can be applied in three days.

On the first day, the under coat or filler is applied, on the next the color and body coat, and on the third day the varnish or finish. With their outfit are furnished two brushes and three sheets of sand paper. Finish may be had in black and twelve colors and the colors are said to cover the old paint on the car.

Fix that casing right—and give me some of those GOODRICH Patches

The National Thrift Habit has come to stay.

Motorists this year are going to insist upon good repairs—with the best repair materials—and they will demand for their own use a *known* brand of tire accessories.

Goodrich Repair Materials are by far the best and most economical in the long run for tire repairers. If no where else Goodrich Quality surely counts here. Your reputation depends on how your repairs last. You can afford to use nothing but the best. For the motorist's own use Goodrich Accessories yield you a good substantial profit and sell easily.

Stock now—on Goodrich Accessories and Repair Material.

Livingston Radiators.

The Livingston Radiator Corp., 203 W. 75th Street, New York City, are introducing their "Bull Dog" combination radiator and Streamline hood for Ford cars. This

Bulldog Radiator and Hood for Ford Cars.

radiator is extremely efficient and is constructed according to the latest design.

The company claims that even though the cooling medium be frozen, the radiator will not be damaged. The combination hood and radiator as shown in the cut is extremely attractive in appearance, while the cost is extremely low. Our readers should write for catalog and descriptive matter.

A New Vice-President.

L. P. Prossen has resigned as Mechanical Superintendent of the Black & White Taxicab Company, New York City, and become associated with the Nilson-Miller Company of Hoboken, N. J. Mr. Prossen has been elected Vice-President and will be in charge of the Gear Cutting, Piston and Piston Ring Departments.

Red Star Timer for Fords.

Since war days have been here and we have all more or less been forced to drive our old cars longer and buy new parts for them oftener, the general tendency has been to buy better parts. Parts that will keep the old car running longer and give more wear.

The timer of Ford cars has always been more or less a source of trouble. In fact, this has developed to such proportions that the demand for a Timer that would really wear, has followed automatically, and this is the reason why the Red Star Timer for

Fords has gained quick favor with the Ford public.

In building this timer special attention has been given to the parts that wear out the quickest, namely the race and roller. The Red Star Timer race is made of the best quality bone-fibre. It is natural color and cured until it is very hard and durable. It is also made of one piece throughout and not built up in layers. Therefore, crumbling and coming apart are impossible.

The roller of the Red Star Timer is designed to roll under all conditions. The roller on a roller principle is applied giving virtually a roller bearing roller. This reduces wear to a minimum and tends to give extremely long life and lots of service.

Each Red Star timer is stamped with a Red Star right on the timer shell. This is quite an innovation in Ford timers and the company are featuring it in all of their advertising. It marks it as their own product and is a precautionary measure against substitution.

White Stripe Transmission Lining.

The service which transmission lining undergoes in the Ford car is very severe. It is subjected to scalding oil, burning friction, and great stresses in bringing the car to a stop. Under this kind of treatment it is no wonder that fabric should become hard and polished and then be unable to deliver efficient work.

To provide a better transmission lining, the engineers of the Advance Automobile Accessories Corporation, 56 East Randolph St., Chicago, have worked out a treatment and a method of administering it which results in increased efficiency and life. This treatment, it is claimed, per-

meates each thread of the fabric and protects it better from the scalding oil than anything else ever devised. The effect of this better protection is obvious.

The oil cannot penetrate the fabric, harden and cause it to become stiff and unresponsive to pressure. It stays soft, presenting a good braking surface to the drum of the car for a much longer period than ordinary lining.

White Stripe Lining is unique in that it is the first transmission lining for Ford cars which has been identified by a distinctive marking so that it can readily be identified whether it is sold to the Ford owner from the roll or in boxes.

Norman S. Hobson Becomes Field Representative for the Connecticut Telephone & Electric Co.

Upon his release from military service, Norman S. Hobson has associated himself with The Connecticut Telephone & Electric Company of Meriden, Connecticut, and will handle the sale of that Company's products in New England and upper New York State.

Carbon-X.

A truly "New and Interesting Thing in Motordom" has apparently made its appearance in the advent of Carbon-X, the Guaranteed Carbon Consumer, which is being introduced by "C-P" Chemical Company, 305-326 River Street, Chicago.

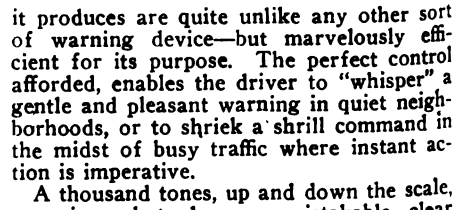
At the first glance, one might form the opinion that Carbon-X is just "another carbon remover," but reference to almost any dictionary will quickly show that "consuming" carbon is a vastly different operation from "removing" carbon. Hence it would seem that Carbon-X is in a class by itself, and is really something new.

It is claimed that Carbon-X consumes the deposited carbon, as fuel, thereby delivering all the power that gasoline contains to the crank-shaft. Since carbon deposits represent the un-consumed portion of the gasoline, it is reasonable to assume that if all the gasoline were "consumed" better mileage would be obtained than if only part of it was consumed and the balance "removed."

"C-P" Chemical Company has published a little booklet entitled "Why Is Carbon?" which discusses the carbon problem in a very interesting manner, and which will be sent to anyone on request. We suggest that our readers obtain a copy of this booklet and then try Carbon-X.

Black & Decker Add to Their Organization.

The Black & Decker Manufacturing Company, Baltimore, Md., makers of Portable Electric Drills and Electric Air Compressors, announce that Mr. D. G. Caywood, formerly Sales Manager of The Brunner Manufacturing Company, Utica, N. Y., has joined them in the capacity of Special Representative, to carry on the field work in the distribution of the Black and Decker specialized products. Mr. Caywood was among the first to see the wide possibilities of the Electric Air Compressor and has been actively engaged in this field for the last fifteen years.



Mr. Graham W. Brogan, Advertising Manager of The Duesenberg Motors Corporation, will also join the Black & Decker organization on January 15th, to handle their publicity.

Both Mr. Caywood and Mr. Brogan will have their headquarters at the Baltimore factory of The Black & Decker Manufacturing Company.

The Victory Siren.

A distinctive and unique warning signal is the clever little device coming into wide favor just now under the name "Victory Siren." It attaches to the exhaust manifold of any car in a few minutes, is controlled from the dash or steering column, and sings "like a mocking bird."

The charming, musical warbles and trills

Victory Siren.

it produces are quite unlike any other sort of warning device—but marvelously efficient for its purpose. The perfect control afforded, enables the driver to "whisper" a gentle and pleasant warning in quiet neighborhoods, or to shriek a shrill command in the midst of busy traffic where instant action is imperative.

A thousand tones, up and down the scale, are given—but always unmistakable, clear and compelling. The device is sold through the jobbing trade and by practically all dealers. It is beautifully finished in polished brass, and is manufactured by the Inter-State Tool & Manufacturing Co., St. Louis, Mo.

The New York Passenger Car Show Ends.

With sounding of horns and the cries from thousands of throats, the most successful passenger car show that has ever been staged in New York ended on Saturday, February 8.

The writer made a point of interviewing a large percentage of the exhibitors and without exception every one of them indorsed the present management, giving unqualified praise to the secretary, Charles A. Stewart.

And Mr. Stewart certainly deserves praise for his able management. The amount of business was enormous, the spirit of optimism pervaded the show at all times and courtesy was the keynote.

Because of manufacturing conditions, there were but few really new models of finished cars, in fact the Phianna, shown in the Armory, and the Essex, exhibited at the Garden, were the only two wholly new models on exhibit for the first time.

At the conclusion of the show, the passenger cars and accessories were removed and the space cleared for the truck show which opened on Monday, February the 10th.

NEWARK SHOW PAPER.

If Newark's automobile show is a failure, it won't be because of poor management, for they have shown that they are up to the minute by publishing a co-operative paper of suggestions which they are sending around to the trade. This four-page sheet is full of interesting information and gives a number of suggestions for displays and booths.

NOT ALWAYS APPROPRIATE.

"Sand," remarked the head salesman, "is the most necessary quality in an automobile salesman. It can be used in any business at any time, anywhere."

"Just a minute," interrupted the cub, "do you recommend its use in our cars on the clutch or in the gears?"

HOW TRUE!

We are indebted to Harper's Magazine for this wise anl truthful bit of humor:

The teacher had been telling her class about the rhinoceros family. "Now name some things," she said, "that are very dangerous to get near to, and that have horns?"

"Automobiles!" promptly answered Johnny.

FORTUNATE?

Brown (on fishing trip)—Boys, the boat is sinking! Is there anyone here who knows how to pray?

Jones (eagerly)—I do.

Brown—All right. You pray, and the rest of us will put on life belts. They're one shy.

Digitized by Google

The General Cord Tire.

The General Cord Tire is of two-cure construction, expanded on a specially constructed air bag instead of the usual steel core.

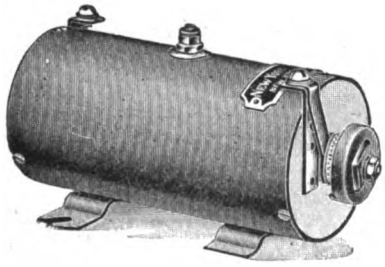
Every cord is expanded equally to the fraction of an inch, and the tire is cured while the cords are thus stretched to the degree that inflation on the wheel would have stretched them.

Thus when the tire is inflated on the wheel, it is in the same condition that it was when cured. The rubber and fabric is *not* stretched, it gives naturally to road obstructions, the rubber doesn't cut, split, rim-cut or separate from the fabric as in

A General Cord Tire.

the case where inflation on the wheel puts the whole tire structure under tension.

It is claimed that 36x4½ General Cord is as large as the largest 37x5 fabric tire and in addition has eight plies of cords as against the seven plies of fabric in the 37x5 fabric tire.



Yet the 36x4½ General Cord—as large a tire and with one more ply is said to cost 10% less than the 37x5 fabric tire, and gives "cord" comfort, class and economy in addition.

The General Cord Tire for passenger cars is made with both ribbed and nonskid treads, in sizes from 32x3½ up to 37x5.

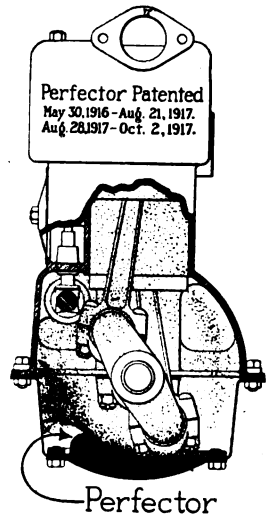
New York Replacement Coils.

For the past several years, the New York Coil Company, 338 Pearl Street, New York City, have been manufacturing a complete line of Replacement Coils interchangeable with those supplied on all modern battery ignition equipped cars.

The above Company claim that these Coils produce a veritable flame at all engine speeds on the minimum amount of battery energy, and that they are guaranteed

A New York Replacement Coil.

to give perfect service even when the voltage is very low, insuring easy starting and thereby greatly increasing the life of the storage battery.



Hundreds of Dealers who are handling these Coils have found that it has added a most profitable addition to the business as by having a very small quantity of coils in stock, they are enabled to replace a defective coil and keep the car in operation without the delay of having to send to the factory for a new coil.

A circular describing the proper model coil for any make of car will be supplied to all interested dealers, together with prices which should prove exceedingly attractive.

Oiling System Perfector.

The Perfector Mfg. Co., Dept. E., Los Angeles, Cal., are putting on the market a little device which deserves the attention of our readers for the very reason that it tends to reduce carbon deposits in the Ford engine.

Every reader who has had experience with Ford cars, realizes that one of their principal troubles is excessive carbonization, particularly in cylinders one and two. This is partly due to the fact that the oil in the splash pans of cylinders one and two is deeper and when the connecting rods dip into it the splash is greater than in the other two cylinders.

The device called the Perfector is simply a cleverly designed baffle plate which is designed to fit in the Ford crank-case and prevent the direct splash of the oil from working into the cylinders. Better lubrication is secured because the Perfector tends to break up the oil into a fine spray. There is no chance for the direct splash to reach the cylinders.

The Perfector may be installed in a very few minutes. There are no holes to bore, no alterations to be made, since the device clamps between the hand hole plates and the crank case at the bottom of the engine.

Representative for the East.

The Corcoran Mfg. Co. of Cincinnati, Ohio, have decided to carry on a big selling campaign and have appointed Mr. J. W. Flannery to represent them in the East. Mr. Flannery is well known to the trade as a very capable man.

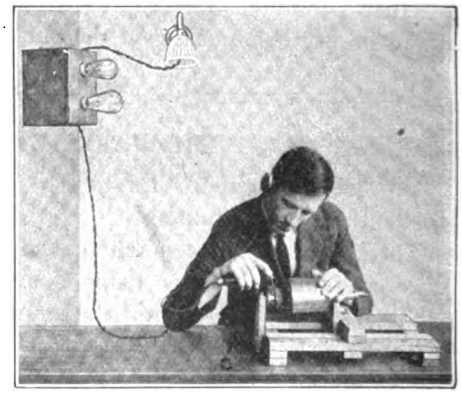
The Ambu Armature Tester.

No more guesswork when called upon to diagnose and locate trouble in a dynamo or motor that is not delivering its full rated capacity. With the Ambu Armature Tester any electrician can very quickly locate any short circuit, open circuit, ground or reversed connection in any faulty armature if it is equipped with a commutator.

Regardless of the size of the armature, one man alone, can handle all the tests with this device and locate exactly the trouble and tell what the fault is. As the Ambu Tester weighs but 7 pounds, complete, it can easily be carried and used anywhere. With all its accuracy and dependability it needs neither voltmeters or ammeters for the indications are all by sound and not by dials and pointers. This sturdiness and absence of finely adjusted mechanism commends it to every electric mechanic.

One great feature of the Ambu Armature Tester is that it will operate on any A. C. or D. C. circuit from 6 to 220 volts, and it takes less than one ampere of current from any line on which it is connected. The Ambu Tester can be used on a storage battery or even on a hand generator current.

The Ambu Armature Tester consists, as shown by the illustration of three parts, connected by duplex insulated wire: a resistance and condenser box, containing a current interrupter; a telephone receiver with head clamp; and the Tester Head. As an auxiliary in testing for grounds, is supplied a ground plate and wire.



This Tester Head is composed of a handle containing a transformer coil the secondary of which is connected to two curved arms that are held in position by springs. Between these two arms, in the end of the tester head are two contact-making pins to bridge the consecutive segments of the armature when testing. These are connected to the primary winding of the coil.

In operation the Ambu Armature Tester is simple as its construction. The condenser box is connected by means of the plug, to the line circuit and the proper lamp resistance put in place; the telephone receiver is clamped to the ear and you are ready for the test.

The armature need not be taken from its place if it is possible to swing the brushes back away from the commutator far enough to permit easy working. However, with small armatures it is advisable to take them out and put them on a stand for the testing is easier and, if trouble is found, they have to come out anyway.

The Tester Head is grasped firmly in either hand and pressed down on the commutator, spreading the spring arms, until the contact points are resting on two adjacent segments. Instantly there is a humming tone in the telephone receiver at the ear. The tester head is lifted out of contact and moved to the next two segments and again the tone is given.

When the circuit is all right there is a smooth even hum; if an open circuit then there is a sudden very marked increase in the loudness of the tone. A short circuit in the armature is marked by an equally marked decrease in the tone.

The Ambu Armature Tester In Use.

If the connections on any segment are reversed, after a repair job, then every second pair of segments returns the loud tones of an open circuit.

If these tests are made and no change in tone are noted then the trouble must be a ground. To test for this place the ground plate of the tester in contact with the armature shaft and then use but one contact pin on the commutator. When the current is

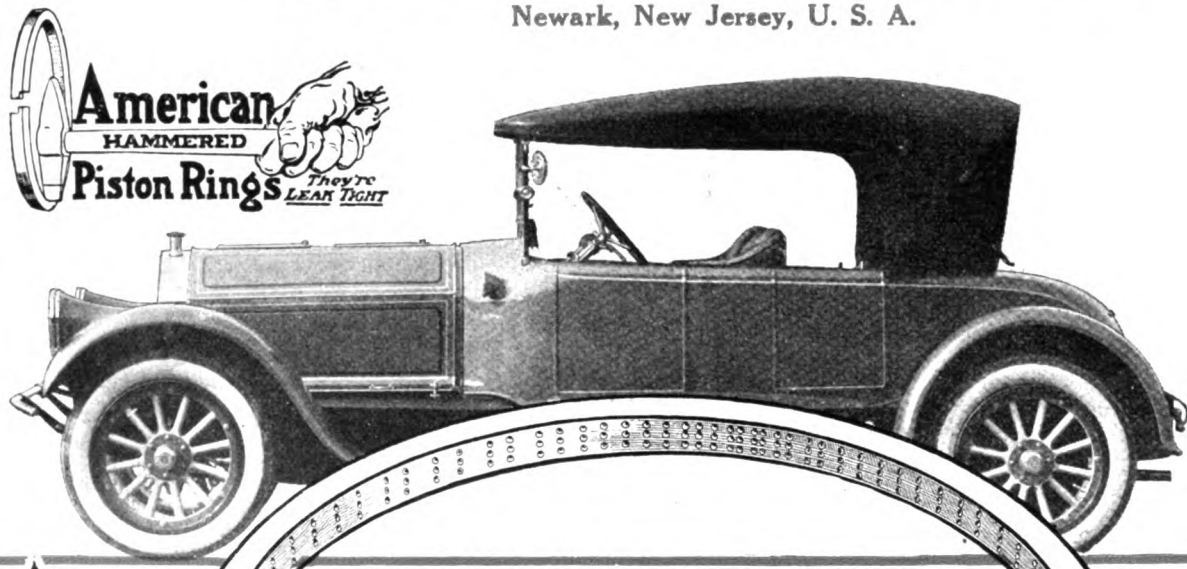
HEROES are born, but calamity discovers them. Articles of merit are made, but it is their users that proclaim them.

Without much ado in advertising, American Hammered Piston Rings have forged to the front —*on merit.*



When Uncle Sam went to war, he took with him motors for truck, tank, aeroplane and tractor equipped with American Hammered Piston Rings—*for a reason.*

In designing the motor that was destined to win new laurels for the already famous Pierce-Arrow car, and increase its power, stamina and efficiency, its builders chose American Hammered Piston Rings to achieve that result.

And so, one by one, the foremost automotive engineers have come to recognize in American Hammered Piston Rings the *ultimate* in piston ring efficiency.

We have an attractive dealer proposition. Write for it.

"Mr. Repairman, how do you account for the immense popularity of

GILL PISTON RINGS"

"Well, I'll tell you, Mr. Jobber—we Repairmen sincerely believe in the Gill Rings we are installing to build confidence in the car owner. Our confidence is built on results secured with this ring; you see there's no come-back. The very physical nature of the Gill Piston Ring cannot fail in keeping every drop of oil out of the cylinder, and every ounce of compression in the cylinder, until the exhaust releases it through the valves. Just naturally then, the car owner gets full face value for his oil and fuel expenditures. He sees the point—we see the point—but the manufacturer saw it first!"

Gill Piston Rings Are Self-Fitting, One-Piece Rings of Very Careful and Sturdy Construction

FOR EASY SALES—THAT STAY SOLD—GILL PISTON RINGS BREAK ALL RECORDS

Their Prestige Makes Argument Unnecessary. Ask Your Jobber—He Knows.

GILL MANUFACTURING CO., 351 W. 59th Street, CHICAGO, ILL.

Advance

Automobile Accessories Corporation

Announces Another Big Money Maker

"Next Best to Cork Insert"

Here is important news to every jobber, dealer and Ford owner. A far better transmission fabric for use in Ford cars has been produced. After months of research and experiment the Advance chemists have made a great discovery. They have developed a chemical treatment which makes transmission fabric resist the scalding hot oil. IT STAYS SOFT AND KEEPS ITS BRAKING EFFICIENCY. They also have perfected the method of applying the new treatment so that it penetrates every tightly-woven fibre.

White Stripe TRANSMISSION LINING for FORD CARS

Means More Money to the Trade on Ford Lining Sales

It will change more of your business on Ford lining from the no-name kind to the trade-marked kind. It will mean more money to you and better value and satisfaction to the consuming trade. Being sold both in boxes and from the roll, it answers every need of dealer and consumer.

Jobbers will want to catalog White Stripe Lining. Attractive electros have been prepared and are awaiting your request.

White Stripe is bound to prove another big money maker for the trade. First—because it is the best transmission fabric for use in the Ford car ever produced. Second—because every foot of the lining is marked by the distinctive white stripe for ready identification.

In Boxes
$2 per set of 3
Rockies west, $2.25
Canada $3

In Rolls 32 cents per foot
Rockies West, 35c Canada, 40c

Send Coupon for Set of White Stripe Lining

White Stripe fills a real need. It supplies the trade with another popular and fast selling accessory. It supplies the Ford owner with lining for the car that will stay soft and hold its good working qualities longer than any other plain fabric.

ADVANCE AUTOMOBILE ACCESSORIES CORP.
Dept. B5, 56 East Randolph St., Chicago

For Ford Owners

Enclosed is $..... for set of three White Stripe Transmission Linings for Fords.

sent through the segment which is nearest the ground the tone will be very dim.

Thus in every kind of trouble, open circuit, short circuit, ground or reversed connections the Ambu Tester will pick out the segments or pair of segments nearest to the fault. And it is all done by sound.

The American Bureau of Engineering, 1025 S. Wabash Avenue, Chicago, the patentees and makers of this remarkably simple but efficient device tell us that it has been in daily use for nearly three years undergoing the most severe tests and trials to prove in every way its absolute infallability.

As any electrician can, with a little practice and experience test any armature, regardless of size, in a very short time, it is more than probable that the demand for this Ambu Armature Tester will reach huge proportions for it is a wonderful time and labor saver. We suggest that you write to the company for further data.

New Distribution Plan for Pyrene.

A new plan of distribution involving a liberal attitude toward both the jobber and the dealer has been adopted by the Pyrene Manufacturing Company of New York. This plan was put into effect shortly after the appointment of Mr. Walter Bauer as president.

Industrial and dealer business heretofore handled by the Company direct has been turned over to the jobber entirely eliminating all competition between the company and its distributors. Pyrene salesmen will work with distributors' salesmen in developing business.

The Company has offices in Atlanta, Cleveland, Chicago, Kansas City, New York and San Francisco.

New Advertising Department Head.

Mr. G. P. Blackiston, formerly the advertising manager of the Packard Electric Co., the Central Steel Co. and the La Belle Iron Works, has accepted a position with the American Rubber & Tire Co., of Akron, Ohio, as head of their co-operative and advertising department.

The trade will recall that Mr. Blackiston has been an enthusiastic automobile man ever since the advent of that machine, and his experience begins with the time when he drove a single cylinder Cadillac in the early days of the industry.

Automatic Safety Switch.

The Apco Mfg. Company of Providence, for many years recognized as leaders in the Ford equipment field, have made their debut in the tractor business with a new automatic Safety Switch, which is designed to prevent the Fordson tractor front end rising off the ground. Several serious accidents, some of them resulting fatally have been caused by this happening, according to items appearing in the trade papers.

The Apco Switch operates on the gravity system, when the tractor wheels rise to a predetermined height the Switch shuts off the power and permits the wheels to come to earth again. The Fordson manual warns operators against this trouble, but the Apco Switch absolutely prevents it. The device is well made of the best materials and can be put on the machine in five minutes without machine work, simply loosen two crank case bolts, put Switch in place, connect wires and job is done. The manufacturer guarantees the device in every way. Dealers and Jobbers are requested to write for discounts. Every Fordson owner will buy it as life insurance.

Battery Separators.

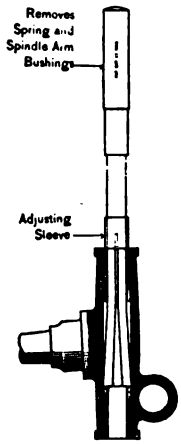
We want to call the attention of our readers to the fact that the Ferry-Mark Mfg. Co., 2117-25 S. 4th Street, St. Louis, Mo., are putting on the market a big line of battery plate separators.

These separators are made from the best of materials, chemically treated, and guaranteed to be scientifically correct. Anyone who is familiar with storage batteries, realizes that new separators must be used in every case where a battery is overhauled.

It is true that the old separators may answer the purpose in some cases. Still, their use is poor economy. At the same time, the battery repairman can ruin the battery by placing a poor grade of separators in it. We should advise our subscribers to investigate the Ferry-Mark line.

Waxit Cleaner and Polish Backed By Efficient Advertising.

The Waxit Mfg. Co. is starting a vigorous advertising campaign to further stimulate the demand on Waxit. Waxit, as the advertisements state, is both cleaner and polish. Its function is first to take off the dirt, grease and dust, and restore the brilliancy of finish which it formerly possessed. Both of these results are accomplished in the same operation. No oily film or waxed surface is produced. The original lustre is brought back.



The various advertisements in the present campaign depict scenes that are familiar to every car owner. For instance, a man is shown looking at his car with an air of despair for he has invited friends to take a ride, and the car is looking the worse for travel. However, the little Waxit girl arrives at the psychological moment with a bottle of Waxit and saves the day. In addition to its journal advertising, the Waxit Company provides their dealers with attractive cut outs and counter displays.

The display pictured is provided free of charge, with the first order of merchandise, and it has been amply demonstrated that it helps materially to move the goods. Waxit is sold in 6 oz., 14 oz. and quart bottles, and half gallon and gallon cans. Dealers are invited to write Waxit Mfg. Co., Old Colony Bldg., Chicago, mentioning this paper, for the attractive dealers' proposition.

Mosco Bushing Remover.

The attention of our readers is called to the unique and interesting device known as the "Mosco" Jiffy Bushing Remover, and sold by the Motor Specialties Co., Waltham, Mass. This device is fitted with an adjustable sleeve and is split about half of its length.

The sections at the sides of the split are resilient and expand except when held together by the sleeve. It may be used for driving out bushings from practically any housing where ½" shafts or bolts are used, but it is designed particularly for driving out spindle bushings on Ford, Chevrolet, Saxon and Dodge and other cars.

Mosco Jiffy Bushing Remover.

Barrett Motor Starter.

Something new in the way of mechanical engine starters is now ready for the market, manufactured by the Barrett Motor Starter Mfg. Co., 1777 Broadway, New York City. For a number of years E. D. Barrett has given his best thoughts to the perfection of this starter and has tried to put out a device which not only is cheap, but reliable in action.

The Barrett starter is said to be built of the very best of material, mechanically correct in design, and so arranged that nothing short of a general smashup of the car and the engine, could end its usefulness.

It operates through a lever at the left side of the car beneath the hood. This lever is connected by means of a rod to a movable handle and is operated by the left hand of the driver. The gears used in the device are made of case hardened chrome nickel steel and are said to be good for the life of the engine.

A self oiling appliance insures lubrication for at least 5000 miles. The device is "back-fire proof" so to speak. In case of a kick-back a gear is automatically released and the crankshaft turns freely without reacting upon the starter. Our readers are advised to write for literature.

Dyke's Automobile Encyclopedia.

As will be seen by reference to the advertisement on another page, the ninth edition of Dyke's Automobile Encyclopedia is announced to have 940 pages and the cost of this new edition will be, postage or expressage prepaid to any part of the United States or Canada, $4.46 This Encyclopedia is a standard work. It covers the whole ground thoroughly and is having a big sale everywhere. Our readers who want to keep thoroughly posted should send to us for a copy at once.

B. F. S. MANUFACTURING COMPANY
54 Hermon Street Worcester, Mass.

A Step Forward.

The Ahlberg Bearing Company of Chicago, one of the best known ball bearing concerns in the country, are taking another long step forward in their rapid advancement since starting in business ten years ago. Their plant which is now located at 2636 Michigan Ave., has for a long time been inadequate for the amount of business they have received but they were unable to erect their proposed new plant due to the fact that the government placed a ban on buildings during the period of the war.

This ban has now been lifted, however, and immediate steps have been taken to erect their new factory and ground has already been broken and from all indications same will be ready for occupancy the latter part of February. This is the first factory of its kind to be erected for the remaking or repairing of old worn out ball bearings.

The new location will be at Twenty-ninth St. and Calumet Ave., which is right in the heart of the Auto district of that city.

The new building will be two stories high and constructed of steel and reinforced concrete, having a floor space of about 20,000 square feet. It is so designed with reference to lighting that every inch of floor space will be available for the handling of the remaking process.

A remade ball bearing up to until about ten years ago was unheard of. The Ahlberg patented grinding device has made possible the salvaging of old worn out ball bearings. This plan immediately became popular as it enabled the ball bearing user to secure remade bearings, which are equal to new in every respect, immediately at a considerable saving.

The demands for their service grew in leaps and bounds. Out-of-town trade became such that it was impossible to handle it from their Chicago plant and immediately branch offices were established carrying a complete stock of bearings in all the large cities throughout the United States with the result that all out-of-town customers are now able to receive twenty-four hour service on practically any ball bearing desired.

Travis Joins Owen Tire Forces

Announcement is made to the motor fraternity that O. L. Travis has been appointed sales manager of the Owen Tire and Rubber Company of Bedford, Ohio, manufacturers of Owen Truck Tires.

Mr. Travis has an unusually wide acquaintance among motorists and dealers throughout the United States because of his extensive travels. He brings to the Owen organization a broad experience in all branches of sales, advertising and merchandising. As an example of Mr. Travis' previous experience with tire manufacturers sales under his directions, and largely due to his personal efforts, have shown marked and decided increases over former output.

Mr. Travis has an extensive knowledge of truck tires, haulage and other conditions affecting the service they give. Going even further, to the advantage of Owen Truck Tire users, he has surrounded himself with men who will co-operate with operators of trucks to the extent of suggesting, not merely an Owen tire but the *right* Owen tire for the particular conditions under which they are to operate.

"Successful selling depends largely upon two things—product and service," says Mr. Travis. "Owen tires are good sellers because of Owen quality—and as for service, well, Owen Service begins before the tire is bought. We help you select the proper tire."

W. J. Johnston Now Field Sales Manager for the Connecticut Telephone & Electric Company.

W. J. Johnston, who for the past seven years has looked after the interests of the Connecticut Telephone & Electric Company with the automobile manufacturers, has been promoted to the rank of Field Sales Manager.

Johnston's experience with the above company began in the days when the Connecticut Telephone & Electric Company was famous for the excellence of the vibrating type coil systems it produced. It was carried through days of the magneto, and has covered every phase of the sales development of the modern Connecticut Automatic Ignition System: the introduction of this system, the conduct of engineering tests, and the handling of the immense amount of detail connected with stepping the sales of Connecticut Automatic Ignition from a modest beginning to the premiere position in the automotive field.

Such an experience could give Mr. Johnston nothing other than an intimate knowledge of his subject, and this, combined with one of the most pleasant personalities a man was ever blessed with, has won for him the good will of practically every man in the industry and endows him with their hearty good wishes in his new assignment.

Hodgkins Is General Sales Manager.

At the recent annual stockholders' meeting of The Cleveland Tractor Company, R. T. Hodgkins, General Sales Manager, was elected a director, and at the meeting of the directors he was elected a vice-president.

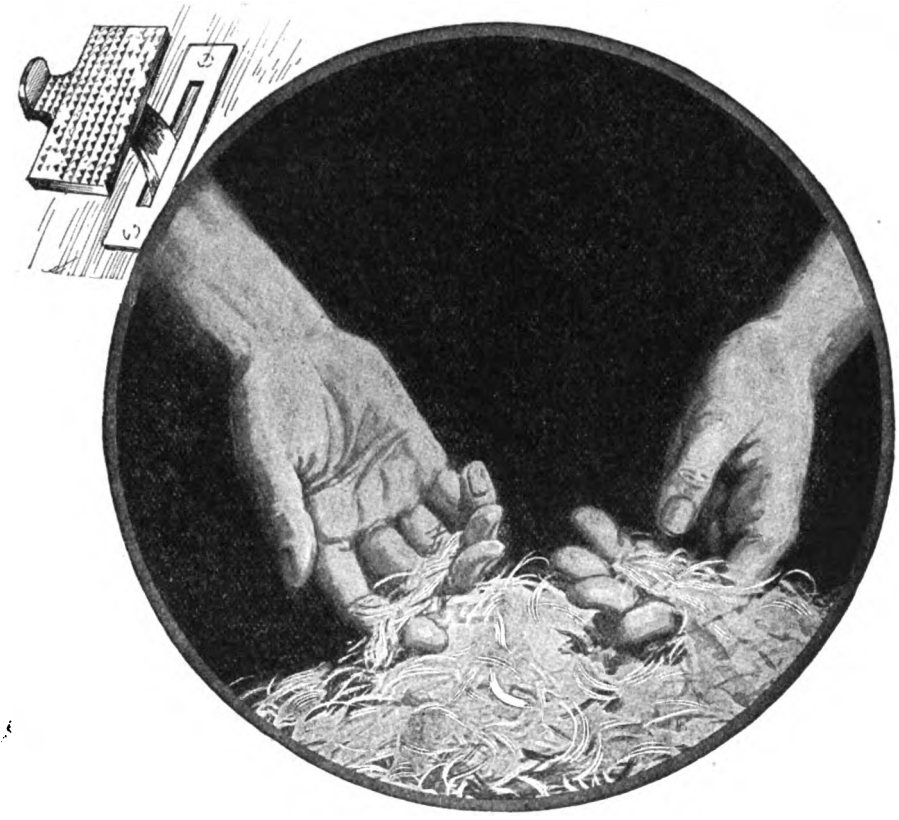
New Features Added to Stanweld Rims.

The new interchangeable features recently adopted by recognized manufacturers together with all the pronounced characteristics of Stanweld rim construction are embodied in the standardized demountable rim just placed on the market by the Standard Parts Company of Cleveland.

Stanweld rims have long been known for their ease of manipulation, lightness in weight, great strength, uniformity and smoothness of finish, and unique locking device.

The locking device is an exclusive feature of Stanweld rims. Though easy to operate, it is most secure. Such care is taken in the mechanical construction that all dangers from rough surfaces at the point of contact are eliminated, thus reducing the possibilities of tire wear.

Separated from the locking parts is the driving stud which is interchangeable on all standardized rims.



The split or opening of the rim is safely removed from the point at which the tire valve stem penetrates the rim. This in itself is a dominating feature. With the opening thus removed, danger of the valve stem threads being damaged as the rim is operated, is eliminated.

An additional advantage to be found in Stanweld rims is the efficiently designed rim wedge. With the Stanweld wedge an even and secure alignment of the rim upon the wheel is certain, a fact of great importance in saving tires from unnecessary wear. The extra large bearing surface of the wedge minimizes squeaking.

Still another distinctive feature is the permanent attachment of the wedge nut within the wedge itself. This permits of more rapid removal or application of the rim and obviates the possibility of the wedge nuts being misplaced or lost.

TONS OF ASBESTOS ARE SORTED TO GET

All brake linings look alike perhaps —but the asbestos in them varies

When you tell a customer "Tons are sorted to get pounds for Non-Burn," he wants to know why.

It's easy to explain that some asbestos is of higher quality than the general run. And that Non-Burn is not only made of the best grade, but is literally "hand-picked" from the finest of asbestos fibre that the world's greatest mines afford.

Your customer will then realize the superiority of Non-Burn. And you will find it the easiest brake lining to sell—because it has this exclusive talking point.

JOHNS-MANVILLE SERVICE COVERS THE CONTINENT

POUNDS OF JOHNS-MANVILLE NON-BURN

To the Trade: A selling policy that is as popular as the brake lining

In the realization that the success of Non-Burn lies as much with the trade as with the consumer, Johns-Manville has long since initiated and still rigidly maintains a Jobber-Dealer Sales Policy, that is fair to all who handle Non-Burn or any other Johns-Manville automotive equipment.

Distributing to dealers only through legitimate jobbers is a co-operative insurance that benefits jobber, dealer and consumer. It has been our aim, not only to make the best lining but to market the best lining by the best method. Anyone using Non-Burn will admit the success of the former, and anyone handling Non-Burn will concede the latter.

To the Trade: Non-Burn is sold only through legitimate trade channels. This protects you against indiscriminate competition and assures you a satisfactory profit.

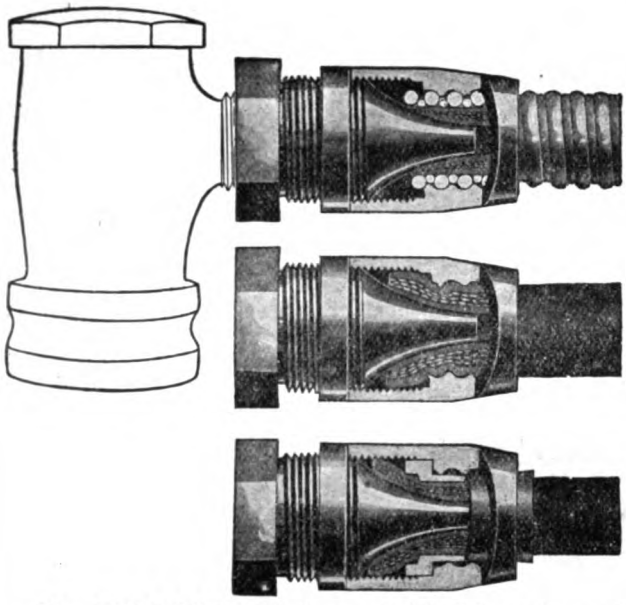
A SURE SIGN of carbon is a smoky exhaust, due to lubrication getting *past* the piston rings up into the combustion chambers where it *burns*. Leaky piston rings waste as high as 25% gasoline —one drop in four.

HI-COMP PISTON RING

THE RING THAT MAKES THE MOTOR SING

are the best gas-tight rings for overcoming engine troubles due to carbon—knocking, skipping, faulty ignition; valve pitting, wearing down of cylinder walls, piston and piston rings; smoky exhausts.

Hi-Comp Piston Rings are made from two perfectly balanced perfect eccentric rings into one absolutely gas-tight concentric ring. Each ring ground under oil — not buffetted — to preserve the true temper of the secret process gray iron and ensure high polish and gas-tight fit. Won't wear cylinders out of round — *proof* of gas-tightness. Make reboring of average cylinders unnecessary — an exclusive Hi-Comp advantage. Hi-Comp Piston Rings deliver every ounce of power from every drop of gasoline on to the piston head — no power or oil can get past them!



It will pay you to install Hi-Comp because of the satisfaction they give to you and your customers. Fully guaranteed by an old established piston ring company to give MORE POWER on less gasoline and oil. Write for booklet, specification chart and details of 90-day trial guarantee

ROMORT
AIR HOSE UNIVERSAL COUPLING

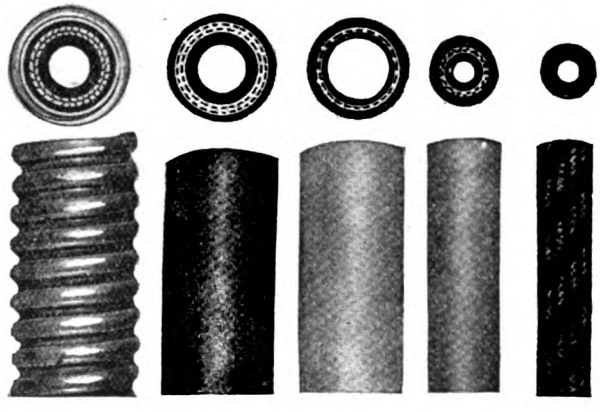
ONE COUPLING to meet the demand for ALL SIZES

The ROMORT Universal Air Hose Coupling takes all sizes of hose as illustrated, or any hose from 5/16 to ¾ inches, outside diameter, whether plain or armored.

The other end of the connection is a ¼ inch thread and fits all ROMORT Automatic Air Valves or other standard connections with standard ¼ inch pipe threads.

The ROMORT Universal Coupling is made of high duty brass with a white nickel finish.

It can be attached to any hose in a minute and positively cannot leak.

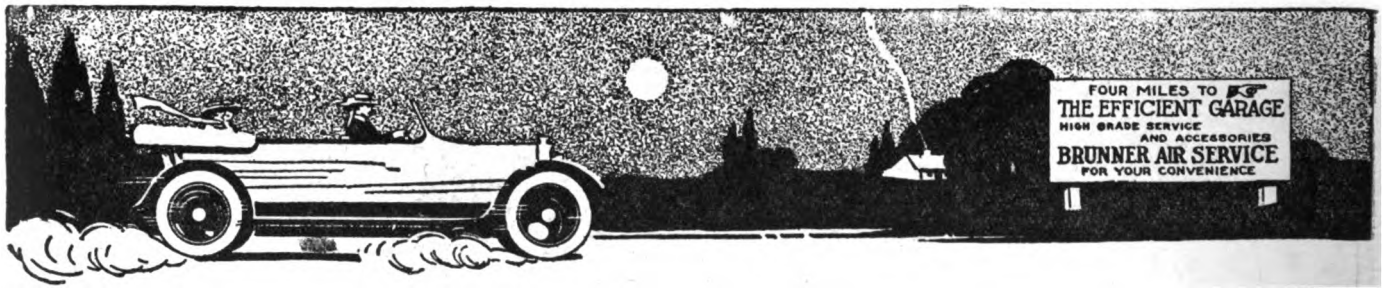


The ROMORT Universal Coupling can be changed from one size of hose to another size at any time.

This is an ideal proposition for jobbers and dealers.

Instead of several different sizes to carry in stock there is but one size ROMORT Universal Coupling.

We have a proposition for jobbers and dealers that is mighty interesting.



Write for details.

Does Your Air Service Pay You?—It Should

Some garagemen fail to realize the necessity of an efficient compressed air system, a leaking tank, valve or hose line compels the compressor to work overtime to replace the wasted air, shortens the life of the compressor and increases the operating cost.

No. 542 Motor Driven Outfit

The outfit includes air gauge, check valves, 25 feet of 3/16" "Resistoil" air hose connected to one No. 82 needle valve on one end and having automatic tire connections on the other.

Get a Brunner Air Sign

It is your best advertisement. It tells the motorist of a garage service sure to please. It gives the motorist confidence in your garage. Display it.

A profitable air service requires not only a Brunner compressor, but a Brunner outfit, Brunner fittings, and a Brunner open-hearth steel tank. Ordinary fittings will not do and a "Range Boiler" used as tank is absolutely unsafe.

INSTALL A BRUNNER GARAGE AIR SYSTEM

This No. 542 Brunner motor-driven outfit with a Model M Brunner automatic controller will automatically maintain a working air pressure between 115 and 140 pounds and will save you both time and labor and will greatly increase the efficiency of your air service. It has ample capacity for garages housing up to 40 or 60 cars; the motor is half horsepower, securely bolted to substantial cast iron base and mounted on a thirty-two gallon open hearth flange steel air tank, tested to 300 pounds. The compressor is our No. 102 two-cylinder, air-cooled, each cylinder fitted with safety valve that can be instantly set for any desired pressure and absolutely dependable under all conditions.

Let us send you Catalog No. 50 and the name of the Jobber handling Brunner Compressed Air Systems in your territory

Of Timely Interest to Garages and Tire Shops

2 Valuable Machines in 1

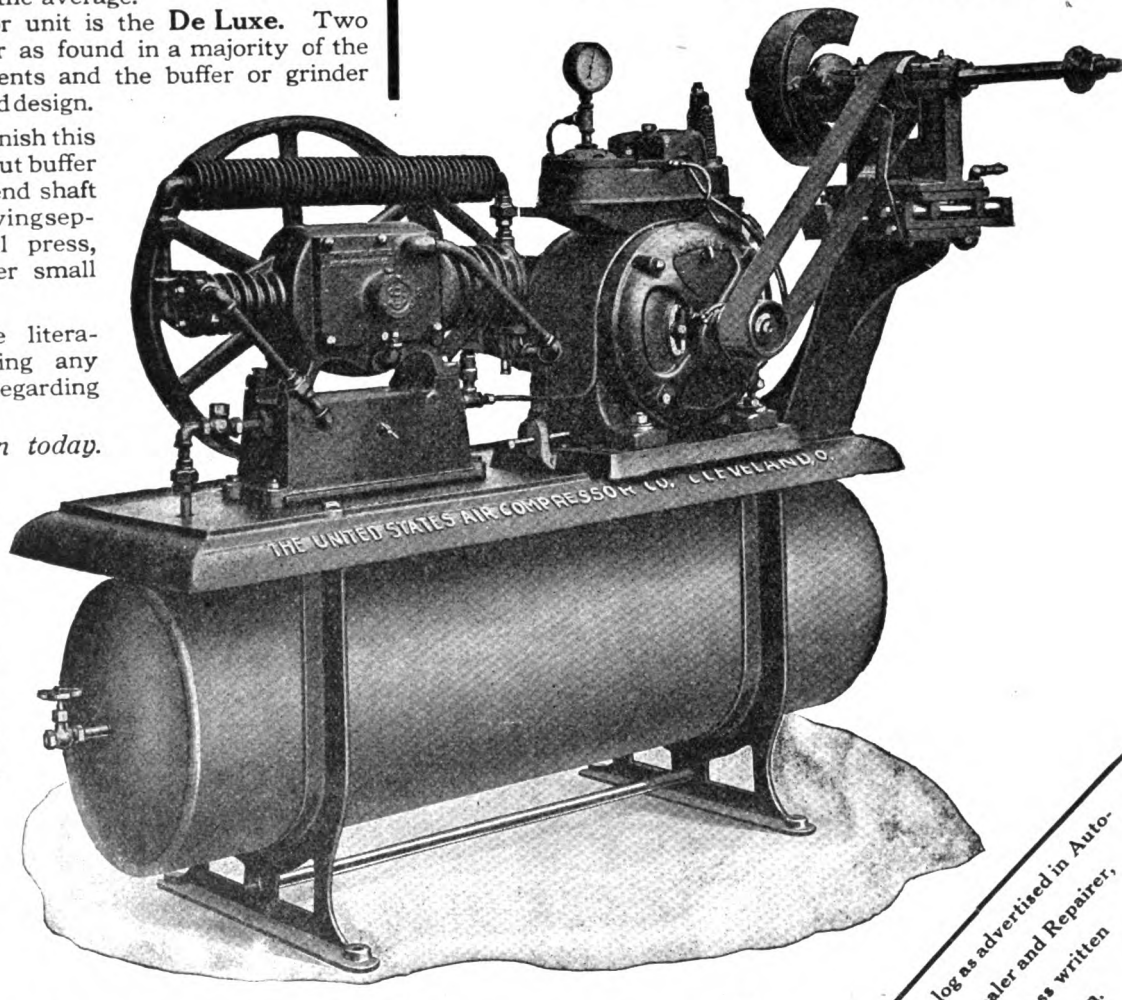
NOW is the time to investigate this new Usaco unit. Don't wait until you have bought two less efficient machines at a greater outlay and then experience regret.

This new number combines an automatic air compressor and a buffer or grinder head into one compact unit so that either can be operated or both at the same time.

It saves the cost of one motor with shafting or countershaft, needs no special installation, conserves valuable space and renders satisfactory service far above the average.

The compressor unit is the **De Luxe.** Two Stage Compressor as found in a majority of the better establishments and the buffer or grinder head is of improved design.

We can also furnish this Compressor without buffer but with double end shaft and pulley for driving separate buffer, drill press, line shaft or other small machine.



Get descriptive literature before making any arrangements regarding new equipment.

DON'T BUY DISTILLED WATER

Distill It Yourself and Save Money

Buying distilled water is a waste of money. The profits that you should have go to someone else. Distill the water yourself and save money by using

The BARNSTEAD WATER STILL

Barnstead Water Stills are high-grade stills made by a firm occupying the foremost position in this field. They are carefully built and thoroughly tested. Operate at extremely low cost with electricity, steam, kerosene or gas. Once started, the operation of the still is automatic, requiring no attention. We have stills that suit your requirements. Let us know just what these requirements are and we will be glad to send you illustrated booklet.

Barnstead Stills Will be Exhibited at the Boston Auto Show. *Space 619*

BARNSTEAD STILL & STERILIZER CO.
3 LANESVILLE TERRACE, FOREST HILLS, BOSTON, MASS.

Barnstead Stills are made in sizes to produce one-half gallon per hour up of distilled water. A still containing a ½-gallon capacity will cost $18.70 and last indefinitely.

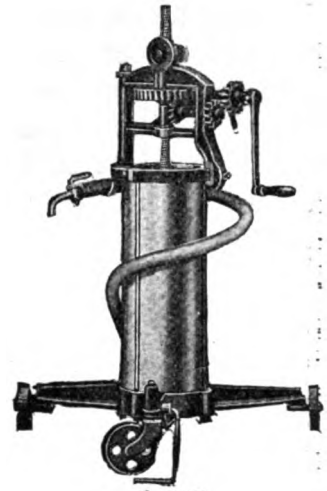
EKERN'S
Portable Garage Grease Guns

Clean, Quick, No Waste of Oil or Grease. Always ready for use and practically indestructible.

Model K

Keep your grease off the floor and prevent waste. Registers the exact amount of grease sold to a customer. These guns will save their cost in a very short time. Are handy, portable, and can be moved to any part of the shop as they are on rollers. Can be re-filled in one or two minutes.



Model K holds 20 pounds of grease or 2½ gallons of oil.

Model N holds 56 pounds of grease or 7 gallons of oil.

Your jobber handles these guns.

Order one from him immediately and install it in your garage.

This Means Bigger Profits for Every Garage Man.

Model N

McPars

1410-12-14 SO. MICHIGAN BOULEVARD, CHICAGO, ILL.

FOR PROFITABLE REPAIRS

The shop seeking battery repairs must be in a position to handle them profitably. A little time—a little strength saved—and material salvaged in every job means just that much more profit—an extra profit that soon pays for these devices to make it possible. They are designed for your benefit.

AMBU CADMIUM TEST OUTFIT.—To test both sets of plates in the storage battery without taking it down. This is proving one of the greatest labor savers—time savers—and battery savers ever offered to the repair man. Consists of specially calibrated and voltmeter with the indicated correct readings shown on the dial in red. A pair of rubber tipped cadmium leads to reach the different plates. Packed in convenient cases with complete instructions. Outfit, complete, **$25.00.** Voltmeter only **$22.50.** Cadmium leads only **$3.00.**

AMBU BATTERY STEAMER.—Softens compound in battery in 15 minutes without danger of injury to jar or connections. Needs no attention. Works while you are busy. Price, complete, **$25.00.**

AMBU BATTERY PLATE PRESS.—To press plates. One of the most valuable "salvage" devices in any shop. **$32.50.**

AMBU PLATE BURNING RACK.—To hold battery plates in position while burning in new ones. Great time saver. **$7.50.**

AMBU LEAD MOLDS.—For molding into convenient, usable form lead scrap and trimmings. Most shops need several. Each **$1.75; $3.25.**

AMBU WIRING DIAGRAMS.—All the 1917 and 1918 cars electrical systems diagrammed. Book of over 180 for **$3.50**; single sheet diagrams of older models, **25 cents** each.

"AUTO STORAGE BATTERY."—A book that tells in simple language all about the care and repair of storage batteries. **$5.00.**

Your jobber is in business for YOUR benefit. While he makes a small profit on the goods he sells he saves you far more in time, worry and money.

If he cannot supply you, write direct to

American Bureau of Engineering, 1025 S. Wabash Ave., Chicago

How You Can Conserve With National Rubber Tire Filler

More Miles per Tire, Less Tires to Buy, No Buying of Tubes at All.

During the period of the war we learned to conserve in many ways,—Food, Fuel, Farmstuff, Man-power and Transportation Facilities were first. The use of NATIONAL RUBBER TIRE FILLER offers you a medium for continuing to conserve without any sacrifice whatever.

Motorists Have No Tire Trouble Who Ride on This Perfect Substitute for Air

Rim-cut-proof, blowout-proof, puncture-proof tires are now a reality. Motoring is now freed from the shackles of tire trouble, and is made safe, comfortable and enjoyable.

National Rubber Tire Filler replaces the inner tube. It has all the resiliency of an air-filled tire with none of its disadvantages. It lasts indefinitely—40,000 miles or more. It has been in use for seven years and has conclusively proven its superiority and economy over air-filled tires. Our factory taxed to capacity is proof positive of its great popularity.

It rides as easy as air.
It cannot puncture or blowout.
It can be used in all style tires.
It can be installed on all makes of rims.
It doubles tire mileage.
It is easily installed.
It stimulates motoring.

A Quick and Everlasting Repair

20th CENTURY'S
Self-Vulcanizing Rubber Back Patch

It is made from a high grade of rubber of two-ply construction. The red prepared rubber face is much superior to the ordinary gray or black rubber facing. The black rubber is similar to inner-tube stock so that when applied it stretches in all directions with the tube, eliminating the strain at the edge. When properly applied this patch will last as long as the inner-tube, and will not leak, loosen, creep or blow out.

NOTE:—Rubber coats, rubber boots, hot water bottles and many kinds of rubber goods can be successfully repaired with this outfit.

CARTON CONTAINS COMPLETE OUTFIT
Consisting of Sheet Self-Vulcanizing Rubber Patch, One Tube Special 20th Century Cement, One Sheet Sandpaper. Put up in three different sizes.

Mr. Sole Distributor---

THE BARRETT FORD STARTER

now being introduced, has proved to be the final solution in Starters. A boy or girl can operate it---no chains---no springs---no batteries---no wires.

1. No up-keep.
2. Easy to install.
3. No holes to drill.
4. Takes no power away from the engine.
5. 75% more leverage than with a hand crank.
6. Automatically releasing gear on back-kick, thus eliminating all danger.
7. Each and every piece of the Barrett Motor Starter guaranteed for 5 years.
8. Simplicity of construction and operation.
9. Essential parts made of Chrome Nickel Steel, case hardened.
10. Ready for starting any time and as often as wanted, because it does not depend on the running of the engine for power.

The special priming device which is part of the Barrett vaporizes the gas directly into the cylinders, making it possible to start from the seat on the coldest day.

Price, Only $25

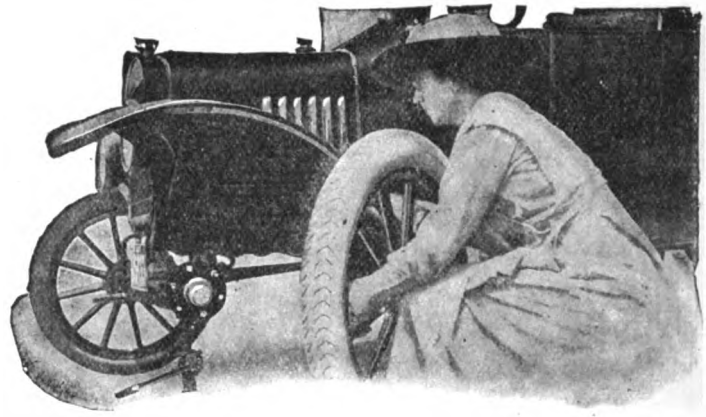
"E-Z-WAY" DEMOUNTABLE OUTFIT

That's it—

FOR FORD CARS

The E-Z-WAY



Change of Wheels so Simple and Easy.

When you have a puncture or blowout—you jack the car up—there is only one tool you need—the Socket Wrench—which comes with the outfit. Only three nuts to remove—slide the wheel off easily—slide on the spare wheel—replace the three nuts—and away you go in three minutes.

No dirt—grease—soiled hands or clothing—in pleasant frame of mind—enjoyed your day's outing.

Complete Set Only $15.00

Including Spare Wheel and Carrier

Suppose one of your wheels broke—the cost of sending or going for a new wheel or being towed to the nearest service station would cost as much as the "E-Z-WAY" besides the delay and loss of time.

The saving in tire cost alone equipping car with the "E-Z-WAY" over demountable rims will more than pay for the outfit. If you equip with rims you must buy 3½" tires and tubes, whereas with the "E-Z-WAY" you use the present Ford wheel and tires on car. The extra spare wheel furnished with outfit is interchangeable on the four corners of the car. It's a great success, because it's easy.

Write to us for full information. Good dealers' proposition.

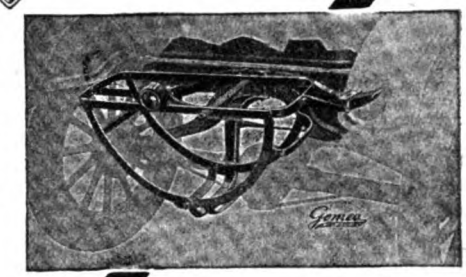
"Why Don't You Get All that's Coming To You in Supply Profits?"

Asks Jem Coe, the Cop

With the GEMCO line, you can offer the motorist a brand he knows, at a price he'll pay. There'll be a shortage of new cars for the next two or three years. This means the old cars will be made more comfortable with accessories on which *some* dealers will make good profits. Will you be one of those dealers? A few of the big winners in the GEMCO line are shown here. Write for a GEMCO catalog and be ready to get *all* your share of this business.

One-Stroke Service Jack

is adjusted quickly to lift a high or low car, regardless of weight, merely by pushing handle to the floor. Satisfaction guaranteed. List, $15.



GEMCO E-Z Tilt Steering Wheels

for Ford and Chevrolet "490" cars are conveniently and quickly tilted. No time is required for releasing nor for relocking. The mechanism is simple in design and absolutely first-class in every other respect.

Easily the most universally adaptable of the GEMCO Bumpers. It is of a very attractive design—is heavier than the GEMCO Special, fits more cars, and like the Special, may be used as a rear end bumper.

Basket Type Tire Carrier

A fast-selling Ford Accessory. Furnished with Bumper or without. GEMCO Tire Lock can be attached. List, $5.80 without Bumper.

Gemco MILWAUKEE "POPULAR AUTOMOBILE ACCESSORIES"

Accessories

are made in a big factory devoted exclusively to this line.

SMITH TIRES

THINK OF IT!

A 7,000 Mile Guarantee

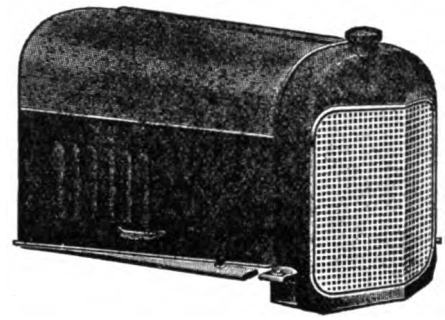
Why? Because it's a hand made Tire. Because it possesses strong features that no other tire can claim. Because we practice a strict specialization in the very highest quality materials. It is a major product—matching men's ideals of clean, sane, fair, generous manufacturing. Hand made, head made, heart made—altogether man made—and they show the treatment.

Watch Your Step

Examine carefully other makes of tires—the more you do, the more certain we are of making you a customer.

The sweetness of low price never equals the bitterness of poor quality.

Goods of merit—great value—giving the squarest kind of a deal—these are the three cornerstones on which we are building.



If you would be SURE—buy The Smith $ Saver "S" Tread Tires.

THE DIFFERENCE

between what seems to serve and what really does serve is now measurable because you have a standard starting point.

Any old thing as a clutch seemed to be good at one time until we took the "see" out of seemed and put it where it belonged—in

The "Evans" Model

"HELE-SHAW" CLUTCH

(It is Patented)

The "Hele-Shaw" Clutch (for motor cars and all other mechanical drives) is the result of constant experiment and experience—a costly and aggressive initiative to prove that none of us need stay in a groove—that efficiency in a clutch could be obtained by looking at the whole idea as a coveted attainable prize worth winning.

Our "Hele-Shaw" Clutch was exclusively specified by the United States Government for use in three-ton Artillery Tractors. Thousands of "Hele-Shaw" Clutches are standard equipment in four-wheel drive Government Trucks.

In theory, design and actual results gained, it is undoubtedly unique in the art and the most advanced to date. For the best—the very best results, we believe it advisable for clutch users to employ these

CERTAIN AND SETTLED RESULTS

in their work instead of risking the old, or untried fields. Make us prove it —write for full particulars and catalog.

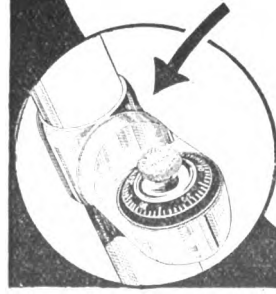
F.O.B.

COMBINATION AUTO



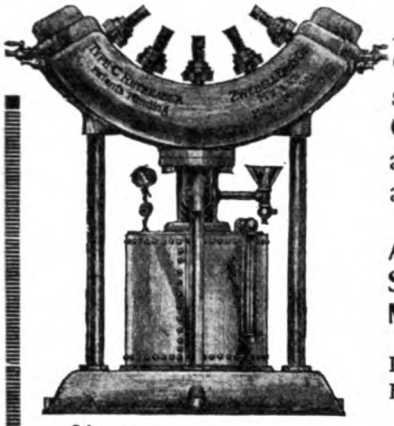
LOCK

Can be sold by Automobile Dealers and Garage men because

1st.—When shown the car owner, he appreciates immediately why the lock makes his car thief proof.

2nd.—Every car owner needs a lock, but knows a thief can pick a key lock with a hairpin. He has been waiting for a practical combination lock, and here it is.

3rd.—The F. O. B. Mfg. Co. guarantees the lock to last longer than the car. Besides making the car thief proof, the lock itself is fully guaranteed.



Call at our booth at the New York Show from Feb. 1st to Feb. 8th and convince yourself of the F.O.B. Lock's superiority over any lock you ever saw.

HOW TO BECOME AN EXPERT AUTOMOBILE MECHANICIAN

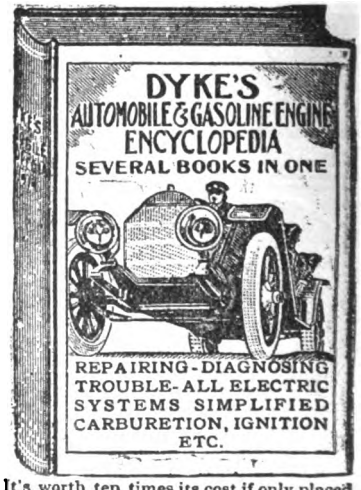
$4.46 NINTH EDITION $4.46 DYKE'S AUTOMOBILE ENCYCLOPEDIA

Entirely re-written, hundreds of illustrations and many new subjects added. Practically a new book. A non-technical treatise with simplified illustrations on Constructions, Operation, Repairs and Adjustments, Cares and Troubles of the Automobile.

There are 50 **Instructions**—Simplified and practical
3500 **Illustrations**—the kind you understand at a glance.
3 **Supplements**, parts printed in colors, treating on the construction, operation, repairing and adjusting of the **FORD** and **PACKARD**—tells how to make a Ford do 60 miles an hour; how to get more mileage per gallon; how to convert into a truck, racer; fine point adjustments, etc. **Airplane Supplement.**
775 illustrations and 279 pages on **Electric Ignition, Electric Starters and Generators**, etc.
51 pages and 254 illustrations on **Adjustments, Tests**, etc., of leading **Electric Systems.**
154 pages and 1189 illustrations on **Repairing.** Oxy-Acetylene welding, and subjects as Repairs on all types of Axles, Differentials, Steering Devices thoroughly covered—as well as all parts of the Engine.
27 pages and 180 illustrations on **Tires and Tire Repairing.**
44 pages and 119 illustrations on **Carburetion.**
89 pages and 291 illustrations on **Engines and Parts.**
16 pages on **Digest of Troubles.**
6000 lines to the **Index.** This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. **Index** begins on **colored** paper, easy to refer to.
Dictionary is also included, which gives the meaning of motoring terms.
Inserts: There are five—printed in colors New features you never before saw or heard of in one of the inserts.

NEW ADDITIONS
TRUCKS, TRACTORS, MOTORCYCLES, AIRPLANES AND LIBERTY ENGINE

Price $4.46, Prepaid.



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

***You will like this book*, in fact we will guarantee you would not sell it for three times its cost if you could not get another.**

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

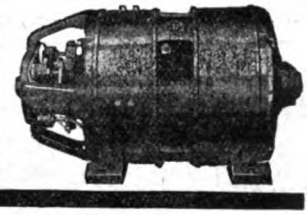
YOU CAN MAKE BIG PROFITS
Charging Auto Storage Batteries

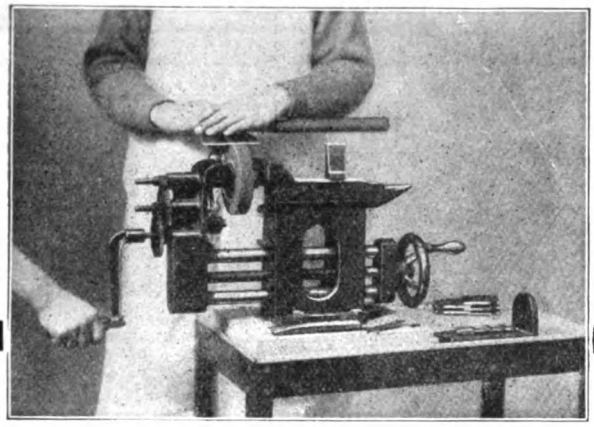


In the winter months, heavy starter service when the engine is cold and excessive use of lights on account of shorter days, quickly drain the automobile storage battery and bring big profits in battery charging. The very thing that makes business run low in other lines makes battery charging run highest. Hundreds of owners of HB Charging Equipment are clearing

$150 to $200 a Month Extra Profit

Some even more. What you can make depends entirely upon yourself. If you go into this business right and push it hard so as to need large capacity to charge the batteries that will be brought to you, we recommend this new 32-Battery Capacity Charger. It contains an amply designed 5 H. P. Motor, operating from city current and developing 2 K. W. Generator capacity. It will charge 32 6-volt batteries or their equivalent at one time. Four separate charging lines and panels permit individual attention to every battery. It is a real money maker, which, with convenient terms of payment offered

with this 32 Battery Capacity Charger



Will Easily Pay for Itself

while you use it. Under absolute money-back guarantee you run no risk. Write at once for further information, prices and terms. Start this money-making business now.

We can furnish smaller outfits, either for use on city current or with belt drive. Write for further information.

Have You Had Trouble With Your Tires?

The fault is not with the tires. You, or your chauffeur, or both, are to blame. The responsibility is yours because you should keep the tires pumped up to a specified pressure, and don't.

Tires that are kept up to the proper air pressure last twice as long—sometimes ten times longer—than tires that are run with not enough air in them. Measure your air daily with a

SCHRADER UNIVERSAL TIRE PRESSURE GAUGE

and get out of your tires all the miles they can give.

Price in U. S. A. **$1.50**

IMPORTANT POINTS ABOUT PAINT AND VARNISH BRUSHES

A Set of Three Brushes and the Automobile Dealer and Repairer for One Year for $2.00.

Showing Brushes One-Half Actual Size.

Did it ever occur to you that there was much difference between a good paint or varnish brush and a poor one? Probably not. To most people a brush is just a brush. Yet an analysis shows that there is an almost measureless difference between a good brush and poor one.

For instance, a properly made Flowing Fitch brush is hermetically sealed, so as to keep the paint, or whatever may be used, from getting into the brush at the top and loosening the hairs. All such properly made brushes are solidly set in glue cement inside a leak-proof ferrule, and a whole row of neatly clinched nails are driven in at the end of the ferrule to give added security, and a guarantee that the hairs will not pull out.

A Fitch brush is *smooth, soft,* and *flowing,* and does not "mush" up or get flabby like a cheap brush, but holds its springiness. The trouble with cheap brushes is that the ferrule is nothing more than a single band of tin, open at the top, with a couple of nails jabbed through. When you use such a brush the cheap hair will pull out and scatter all over your work, because it is not held securely enough to stand the drag of the brush in painting or varnishing.

A brush may be washed with gasoline or kerosene oil, but to clean it thoroughly turpentine should be used. No brush used for painting should be used for varnishing.

We have recently made arrangements with one of the best manufacturers of these properly made brushes in New York to offer a set of Three in connection with a subscription to the AUTOMOBILE DEALER AND REPAIRER for a year for an even $2.00, except in the 7th and 8th zones the price is $3.00, the subscription rate being $2.00 for a year. These zones comprise the following states: Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, South Dakota, Oklahoma, Oregon, Utah, Washington and Wyoming; also Canal Zone, Guam, Hawaii and Porto Rico, Samoa, Virgin Islands. These brushes sell at retail for $1.40. It will be seen, therefore, that there is a substantial advantage in sending to us for the AUTOMOBILE DEALER AND REPAIRER for a year, and for a set of these brushes.

Present subscribers can have their subscriptions extended for a year, and secure a set of brushes, on the same terms. These brushes are guaranteed in every respect, and though they cost more than cheap brushes would cost, they are far cheaper in the end, because of their lasting qualities and the good work that can be done with them. No man can afford to waste expensive paint and varnish on any vehicle by using a cheap and poorly constructed brush, such as is usually to be found wherever brushes are sold. The ordinary dealer in brushes himself as a rule has very little knowledge of the quality of the brushes he sells.

Remit by check or money order, and your name will be entered as a subscriber to the AUTOMOBILE DEALER AND REPAIRER for a year, and a set of these brushes, which are just the right size and shape (see illustration, which is exactly one-half the actual size of the brushes,) will be sent to you, postage prepaid.

Refinish Your Car Yourself the PANVAR way

Remember the pride you took in the lustrous finish of your car when it was new? Now—time and the elements have worn away that high gloss varnish and only the the paint remains.

Wouldn't it be worth $1.50 plus one hour's work on your part to replace that brilliant finish your car once had?

You can do it with PANVAR.

PANVAR is a durable, transparent, self-leveling, flow-on finish which you yourself can apply to your car as easily and quickly as you would a liquid polish.

In effect, PANVAR is similar to the high gloss finishing varnish that body builders use as a final coat to give the car its lustre.

Unlike varnish, however, PANVAR can be applied by any amateur with assurance of complete success. PANVAR is quick flowing and self-leveling and no experience is required to apply it.

Unlike varnish, too, PANVAR is not affected by weather changes. It will not crack, craze or peel. It will not discolor from water or steam. It resists heat, acid and rust. Makes tops and leather waterproof.

PANVAR can be applied with a brush, sprayer or cloth and dries with a hard, glossy finish in from six to eight hours.

Garage men make big profits refinishing cars over night.

Jobbers and Dealers—PANVAR sells big during the entire year. It enables car owners to refinish their own cars at small expense and slight effort. Many thousands of owners will welcome this opportunity to save the cost of an expensive repainting job.

Write today for discounts, catalogue, electrotypes and mailing literature.

Dealers—Order direct for delivery through your regular jobber.

A free sample of PANVAR will be mailed upon receipt of 10c. in stamps to cover mailing expense.

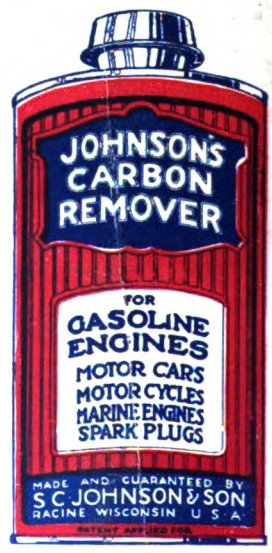
Saves Gasoline

JOHNSON'S CARBON REMOVER

REGULAR use of Johnson's Carbon Remover—once every 500 or 1000 miles—will cure 80% of your engine troubles, and keep the engine right up to the top notch of efficiency all the time. It will increase your power, save 12% to 25% of the gasoline and reduce maintenance expense.

Johnson's Carbon Remover puts new life in your engine. It cleans out carbon, stops knocking and pounding, gives more power on hills, improves the "pick-up" and restores the original "pep" and smoothness.

With proper carbon removal, you'll have better compression and less valve grinding, less ignition trouble and lower oil consumption. Johnson's Carbon Remover is easier, quicker, less expensive, and more effective than any other method — more effective because it is thorough and because you won't neglect to use it often after the first trial.



Do It Yourself—No Trouble

Simply pour an ounce of Johnson's Carbon Remover into each cylinder in the evening. Over night it soaks into the accumulated carbon and leaves it a soft inflammable mass. When you start your engine the next morning this mass burns, pulverizes and is blown out with the exhaust in powder form.

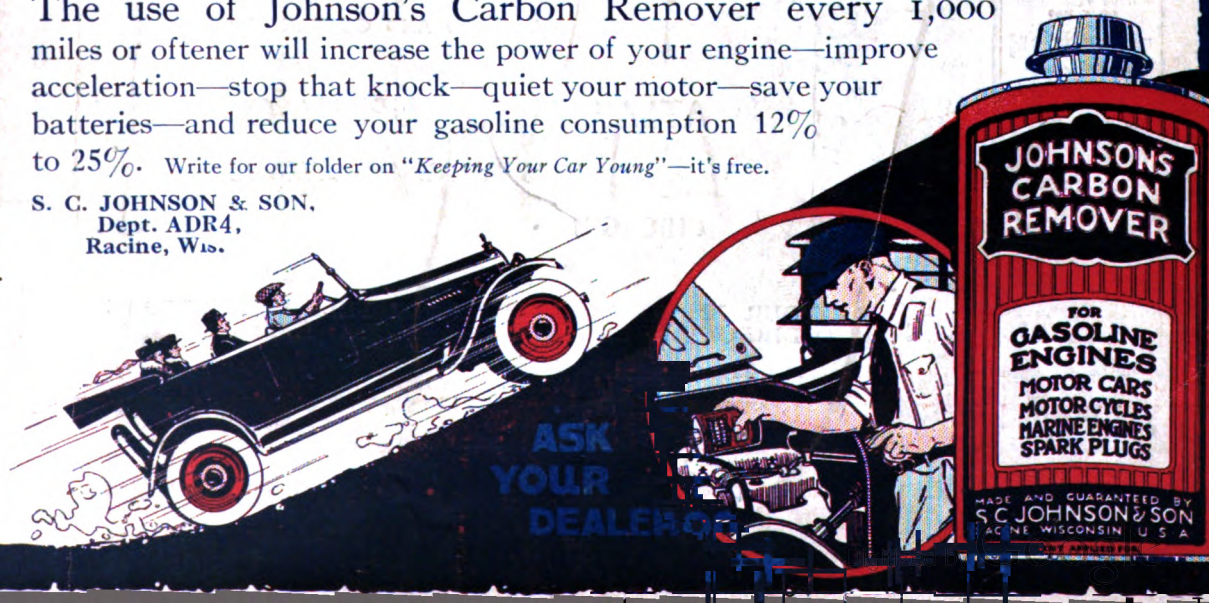
TAKE THE HILLS ON HIGH



WHEN your automobile limps up hills, knocking in protest at climbing them "on high"—it is a sure indication of carbon. The easiest, cleanest, safest and most satisfactory method of removing carbon deposits is with Johnson's Carbon Remover. It will save you $3.00 to $5.00 over any other method, without laying up your car. No time or labor required—you can do it yourself in five minutes.

JOHNSON'S CARBON REMOVER

This is a harmless liquid. It contains no acid and does not affect lubrication in any way or interfere with the oil in the crank case. It has no action on any metal.

The use of Johnson's Carbon Remover every 1,000 miles or oftener will increase the power of your engine—improve acceleration—stop that knock—quiet your motor—save your batteries—and reduce your gasoline consumption 12% to 25%. Write for our folder on "*Keeping Your Car Young*"—it's free.

JOHNSON'S RADIATOR CEMENT

THE easiest and quickest way of repairing leaks in radiators, pumps, water jackets, hose connections, etc., is to use Johnson's Radiator Cement. This will stop the leaks instantly without laying up the car. No mechanical experience is required—all you have to do is remove the cap and pour the liquid into the radiator.

Quick—Efficient—Harmless

Johnson's Radiator Cement blends perfectly with the water until it reaches the leaks—just as soon as it comes in contact with the air it forms a hard, tough, pressure-resisting substance which is insoluble in water and consequently makes a permanent seal.

Johnson's Radiator Cement contains nothing which can coat or clog the cooling system. It will seal leaks in from two to ten minutes.

Quarts $1.75 Pints $1.00 Half-pints 65c

More Mileage for Tubes and Casings

HERE, at last, is a quick and permanent repair for tubes, casings and all rubber goods. With it the most inexperienced motorist can satisfactorily and inexpensively repair his own tubes. No time, labor or heat required. The Patch can be applied in ten minutes—at a cost of 2c—and it's so simple a child can use it.

JOHNSON'S HASTEE PATCH

is much more satisfactory than vulcanizing because there is no danger of burning and spoiling the tube. It gives equally good results on a pin hole puncture or on a large blow out. Is conveniently put up in strips so the user can cut just the right size patch for each particular break.

Johnson's Hastee Patch is filling a long-felt-want for patching rubber boots, hose, hot water bottles, rubbers, rubber coats, bath sprays, auto tops, etc. Don't throw away rubber goods when they spring the first leaks—make them do double service—repair them yourself with Johnson's Hastee Patch.

USE COUPON FOR TRIAL PACKAGE—SATISFACTION GUARANTEED OR YOUR MONEY BACK

Uncle Sam Is Making the boches Sick—Let's Co-operate by Keeping Our Cars Well.

Our feature for September is entitled, "Sick Cars and the Diagnosis," and is a little story semi-humorous in nature, but full of good practical suggestions relative to finding trouble and remedying it.

Digitized by Google

Simply moisten a piece of cheesecloth with a few drops of Lyknu by applying cloth to mouth of bottle. Do not pour!

Go lightly over surface to be polished with dampened end of cloth. Then, rub with same cloth until surface is dry

The Right Way to Use Lyknu

The "One-Cloth" Polish

Coating a car with a film of oil, grease or gum is not polishing it.

Depending upon elbow-grease—and lots of it—to get a clean, shining result—is a waste of time and energy.

The logical way to polish a car is to use Lyknu—and to use it correctly in order to get best results quickly, easily and economically.

Lyknu adds nothing to the car but a polish—no grease, no oil, no gum, no coating of any kind.

It *cleans* and polishes at one easy operation, removing all accumulation, and restoring the automobile's first, fine appearance—*just like new*.

With Lyknu, you don't have to rub laboriously to produce a polish. You rub *only* until surface is dry. Only one cloth needed; only one easy operation.

Lyknu is the economy-polish as well as the quality-polish. It goes three times as far because its spreading quality is three times as great.

Try Lyknu on your own car! If you are a dealer, write on your business letterhead for a 50 cent bottle of Lyknu which will be sent prepaid with our compliments

$3 per set of three
West of Rockies, $3.25

Outwears Several Sets of Ordinary Linings

Easy to identify by
(1) the name
(2) the red box

Be sure to get the genuine CORK INSERT

Makes Any Ford Work Smoother

With Cork Insert Lining in the transmission, a Ford gets away quicker, smoother, quieter—it's a real *smile*-bringer. Under the brake it *glides* to a quiet stop. If the Ford owner's wife has been used to putting the coffee on when she hears him stopping, she'll have to make different arrangements. She won't hear him.

Cork Insert *doesn't chatter* like ordinary lining does—for it doesn't grab and slip—the cause of the vigorous vibration and the noise.

Lasts So Long It's Cheapest in the Long Run

Cork Insert is not only the *most efficient* but also the *most economical* lining to use. It outwears several sets of ordinary linings. Saves the expense of frequent replacements—saves the wear and tear of racking vibration—saves the continual repairing of the rear end—prolongs the life of the car.

You can get Cork Insert at your garageman's or auto supply dealer's. If out, they can quickly get it, for *all jobbers handle it.* Insist on the genuine.

Advance Automobile Accessories Corporation, Dept. K5-1, 56 E. Randolph St., Chicago

Makers also of Cork Insert Brake Lining for all cars—Oil-Proof—Slip-Proof—Squeak-Proof

A No-Stretch Fan Belt for Fords that Doesn't Stretch

Cork Insert doesn't slip as ordinary fan belts do—a slippage that runs as high as 50% to 75%. It keeps the engine cool by keeping the fan fanning. Gives exceedingly long wear.

A Million Motorists Use It

The limited supply and increasing cost of inner tubes make it necessary for motorists to repair punctures, cuts, tears and cracks—to keep their tubes in good repair—as good as new.

Present conditions make it imperative for motorists to stop the easy-going, wasteful habit of carrying $5 to $15 worth of spare tubes—that deteriorate quickly—and scrapping perfectly good inner tubes that merely have a puncture, cut or tear—which can be repaired *permanently* with a Shaler 5-Minute Vulcanizer, quicker than a new tube can be inserted.

Saves Tubes — Saves Repair Bills

You can repair your own tubes—as good as new. It's easy and inexpensive. *The Shaler works automatically* —and without fail. Just touch a match to the non-flaming chemical fuel. In five minutes you have a firm, flat, "feather-edge," permanent repair—stronger than any "stuck on patch"—stronger that the tube itself. No gasoline, cement or flame, and no danger of injuring the tube. Carry it in your tool box for emergency use. It works in the wind, in any weather, anywhere. The heat is applied directly to the pure gum patch and does not extend to the tube itself.

Complete With 12 Patch and Heat Units $1.50

The outfit includes the Vulcanizer—12 Patch & Heat Units (6 round for punctures, and 6 oblong for cuts)—complete, $1.50. Extra Patch & Heat Units 75c per dozen.

Sold by All Accessory Dealers and Jobbers

TO DEALERS—To insure shipments—it is advisable to order from your jobber now. The great demand has exceeded our factory capacity, and shipments will be made according to priority in receipt of orders

"Defies Time and the Elements"

CHASE DREDNAUT Motor Topping

TOPPING material that will fulfill your greatest expectations — Drednaut Motor Topping adds to the beauty of any car.

QUALITY topping through and through—made to give the maximum of service—uniform in strength and finish.

Chase Drednaut Motor Topping (now over twenty-five years on the market) is positively weatherproof in every detail—protection from the severest of storms or the hottest suns—the top material that *"defies time and the elements"* and which often outlasts the life of the car itself. Easily cleansed, always attractive, economical.

AN OPPORTUNE TIME TO RE-TOP. The biggest step towards the rejuvenation of old cars is accomplished when a stunning new top of Drednaut is substituted for that rusty-looking, probably torn, old top. Now is the time to retop and bring cars up to the scratch. Dealers everywhere will furnish you with Chase Drednaut if you so specify.

Chase Drednaut retains its wonderful rich appearance over a long period of severe use.

Don't experiment with inferior materials — make sure by using genuine Chase Drednaut.

Rolling right along.

3,000,000 now in use

In both standing and sales, the Inland Piston Ring is fast taking front rank the world over, because it *solved* the problem of making a *one-piece* ring *completely* gas-tight.

The Inland Spiral Cut principle is an exclusive Inland patent—its advantages cannot be duplicated in any other piston ring at any price.

As a mechanically perfect piston ring, the Inland is emphatically the best piston ring proposition for both dealers and engine owners.

Merit, plus advertising on the broadest scale, has made Inland sales grow by leaps. Sales are now on a basis of *millions per annum.*
